Important Notice for Servicing Monitors

●General Notice :

This service manual is prepared to assist service organizations or engineers who are in charge of servicing monitors in the field. This manual, therefore, is not for end users but for those technically oriented service engineers from distributors, dealers, VARs and other wholesalers or retailers who are capable of servicing the unit.

This manual explains the monitor's outline, detailed features, functions, basic construction of the individual unit and the circuits, sophisticated adjustments and detailed troubleshooting procedures for NANAO monitors.

Please read and understand this manual before attempting service.

This manual uses the following conventions.

DANGER

It indicates a potentially hazardous situation which, if not avoided, will result in death or serious injury.

WARNING

It indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION

It indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury and/or property-damage.

It indicates a prohibited action.

It indicates a general caution.

It indicates a caution which, if not avoided, may result in electric shock.

DANGER

- 1) The monitor contains high voltage circuit. Only experienced service personnel should perform repairs or service work on high voltage monitors.

When the cabinet of the monitor is removed and the monitor is operating, there is a risk of an electric shock hazard.

- 2) When designing and manufacturing the equipment or the product by using the monitor, realize the monitor feature and consider the safety.

- 3) Never modify any part of the equipment without permission by authorized party.

NANAO corporation will not be responsible for any damage or incident caused by an unauthorized modification.

WARNING

- 1) Unplug the power cord before servicing.

Ensure the power cord is disconnected before replacing any parts in the unit. There is a risk of the electric shock hazard or damage.

- 2) Do not wear any metal or accessories.

There is a risk of an electric shock.

●Precautions for Servicing :

1. General

WARNING

- 1) **Do not connect or disconnect any wires or connectors while the monitor is in operation.**

It may result in damage to the circuit or may cause an electric shock.

- 2) **Do not short any portion of any circuit while the monitor is in operation.**

This will cause smoke, electric shock or damage to the transistors, ICs or other parts or circuit in the unit. (*Excluding the Adjustments only when specified.)

- 3) **Do not change the original design of the monitor.**

This will cause smoke, electric shock or damage to the circuit.

- 4) **Replace only with the exact factory recommended spare parts.**

The use of unauthorized substitute parts may cause an electric shock, damage to the monitor, or may exceed the specified X-ray radiation.

- Safety related parts Parts List : "S" Circuit Diagram : "▲"
- X-ray related parts Parts List : "X" Circuit Diagram : "★"
- Anti-static related parts Parts List : "A"
- Moisture protection related parts Parts List : "M"

CAUTION

- 1) **Do not touch the sharp edge of the chassis.**

It may result in injury.

2. Precautions for Servicing CRT

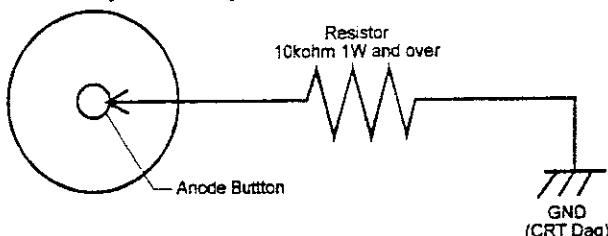

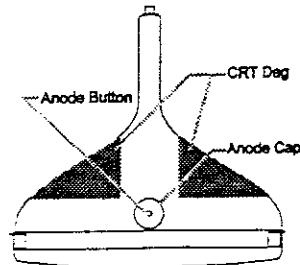

⚠ WARNING

- 1) **Disconnect the Power Cord, and completely remove static charge before taking off the Anode Cap.**

When discharging high voltage, be sure to disconnect the power cord.

Connect a $10k\Omega$ resistor (1W and over) and a insulator wire(such as a test probe) between CRT dag and the Anode Button.

If the High Voltage is not removed, you will get an electric shock by touching the Anode Cap area.

- 2) **Replace with a CRT of the same type number for continued safety.**

The CRT used in this monitor employs integral implosion protection.

If the CRT is replaced with a different type, it will result in an improper circuit function, exceed the specified Safety Standards range, or affect the picture quality guaranteed in the specifications.

- 3) **Use only CRT and PCB cording the same serial number.**

Apply silicon grease around anode button when putting anode cap on. Please make sure that only other material is not attached around contact area.

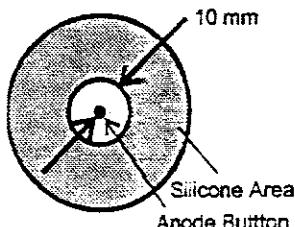

- 4) **Pay your attention to CRT neck and PCB-CRT. Do not touch them to the other material.**

This will cause the damage.

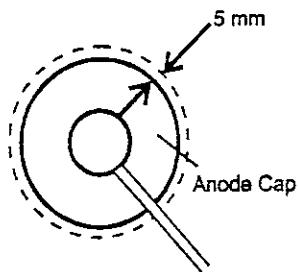

- 5) **Follow the instructions below when mounting the Anode cap.**

Surely mount the Anode cap and paint the silicone grease. High voltage may leak from the Anode cap and there is a risk of electric shock and damage.

- (1) Clean up around the Anode button and inside of the Anode cap.
- (2) Paint the Silicone grease equally around the Anode cap with a paint-brush.
(Recommended grease; KS-650N, Shinetsukagaku)

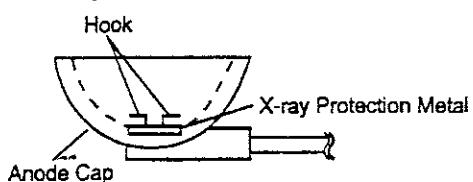

Do not paint inside of 10mm.

Over-painted area may be less than 5mm.

- (3) Lock the hook inside of the Anode cap onto the Anode button and attach the X-ray protection metal onto the Anode button surely.

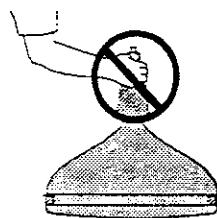

- (4) Confirm that the Anode cap is completely stuck on the surface and any partial tearing or lifting of it should not be recognized.
 - (5) Confirm that the Silicone grease is painted 5mm beyond the Anode cap brim.
-
-

! CAUTION

1) Do not lift the CRT by the neck.

The neck of the CRT is not firm enough to hold the entire CRT. Hold the CRT under your arms when lifting it. In case the CRT is dropped, it could result in injury.

2) Be careful about the followings to keep the special coating for anti-static and good contrast.

- (1) Do not absorb the CRT surface with a vacuum absorption machine. It may damage the coating of the surface.
 - (2) Use a soft cloth to remove dust from the screen. If necessary, stubborn stains can be removed by moistening part of a cloth with water or alcohol (ethanol, methanol, or isopropyl alcohol) to enhance its cleaning power.
Never use cleaners including abrasives or bleacher.
 - (3) Do not scratch or press on the surface with any sharp objects, such as pencil or pen as this may result in damage to the CRT.
 - (4) When carrying the monitor, do not scratch or press on the surface with any sharp objects, such as pencil or pen as this may result in damage to the CRT.
 - (5) Do not paste any seals on the screen. It may make some marks because of the ultra violet rays.
 - (6) Never remove four aluminum foil tapes each corners of the screen. It may result in decrease the anti-static effect.
 - (7) Do not give any impact to the CRT. If you give the impact to the CRT when using the monitor on face top style, there are more internal sparks of CRT than TV style. The internal spark is caused by the coating inside of the CRT that comes off and drops to the guns. Therefore, the impact to the CRT on face top style causes frequent internal sparks and improper Cut Off adjustment of the CRT that makes the screen invisible and loses the white balance. Also, the screen disappears for a moment when the spark occurs.
-

3. Electrical Circuit

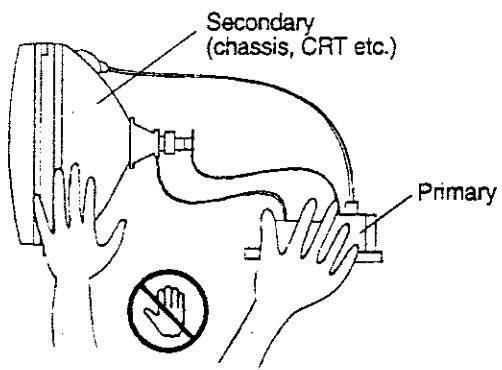

⚠ WARNING

- 1) **Do not touch the +B Voltage and High Voltage terminals inside the monitor.**

The circuits of the monitor is divided into the Primary part and Secondary part which both are insulated. Do not touch the Primary or the Primary and the Secondary at the same time. And do not short both parts. If carelessly contacted, it can cause serious shock or result in damage to the monitor.

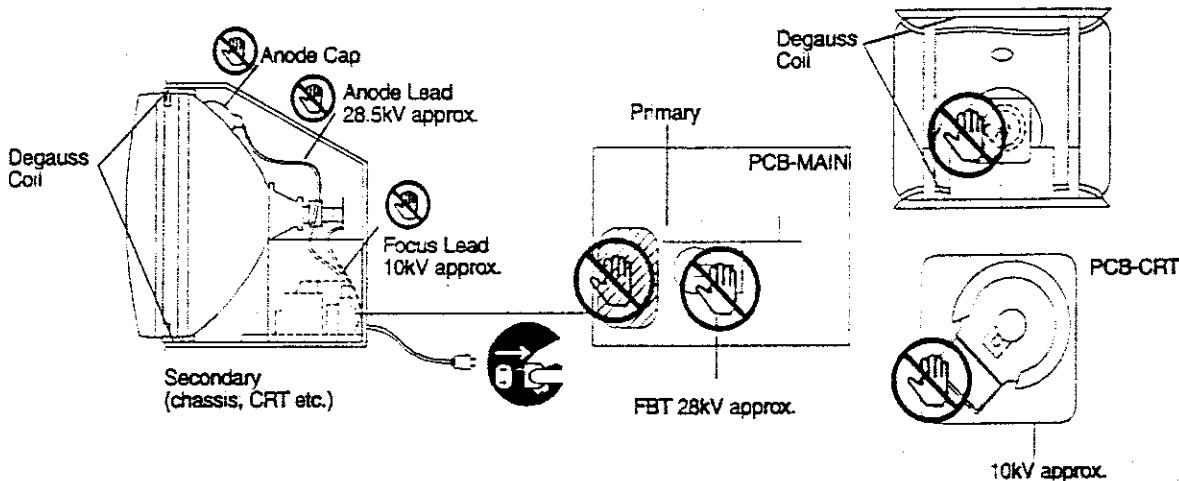

When adjusting, use some dielectric tools and do not touch any other volumes than adjustment ones.

- 2) **Do not touch the inside of the monitor when operating. There is a part generating high voltage more than 20000V inside of the monitor.**

If necessarily, unplug the power cord before touching.
If an object such as solder or paper falls into the monitor, unplug it immediately. It can cause smoke, electric shock or damage to the circuit.

- 3) **Do not operate the monitor with a High Voltage level exceeding the specified range below.**

Failures in the High Voltage Adjustment can increase X-ray radiation.
The maximum High Voltage range specified for operating the monitor is as below.

Specified Power Supply : 100~120V, 220~240V, Beam Current : zero
High Voltage level : 28.0 ± 0.6 kV

To check for the presence of High Voltage, use an accurate high impedance High Voltage Meter connected between the Anode Button and the CRT dag.

It may cause a rise in the voltage when the Power Supply Voltage is out of the specifications range.

- 4) **Do not clamp the high voltage lead (the red lead from FBT) with any other leads.**

The high voltage or static electricity may cause an electric shock or damage to the circuit.

- 5) **Connect the coating earth to the PCB-CRT.**

Otherwise, it may cause an electric shock.

- 6) **Use 2 pin power plug of the Digital voltage meter.**

Otherwise, an electric shock, damage to the circuit or breaker-down may occur.

- 7) **When checking wave on the primary voltage line, use the 2-pin power plug of oscilloscope. Do not connect GND on the primary circuit and GND on the secondary circuit (chassis).**

If not, this may cause electric shock, damage to the circuit or breaker-down.

- 8) **Do not check on the primary and secondary voltage line with same oscilloscope at the same time. If necessary, connect the Isolation Transformer for the power of monitor.**

This may cause an electric shock or damage to the circuit.

4. Others

WARNING

1) Take care not to scratch the coating of the Degauss Coil.

Degauss Coil circuit is on the primary voltage line. When the coating of the Degauss Coil is damaged and the Coil directly touches the chassis or screws, the chassis voltage will become the same as the primary voltage line. This can result in hazardous danger as follows.

- (1) Electric Shock
- (2) Short (Current Leakage)
- (3) Degauss does not work
- (4) Circuit Damage
- (5) Damage of connected computers or peripherals. It can result in a hazardous fire or electric shock. Follow the instructions below.

2) Do not bring any sharp objects such as the edge of the chassis close to the degauss coil, FBT, the anode lead and the focus lead.

This may cause an electric shock or damage to the objects connected.

CAUTION

- 1) If you touch the CRT surface, you may feel a slight electric shock. This is caused by the static electricity being produced on the CRT surface and it does not affect the human body.
 - 2) When bringing one monitor close to another monitor, make sure the monitors' structure and setting. If one monitor has the different vertical frequency, another monitor image may flicker.
 - 3) If you shift horizontal position of the monitor until a part of the displayed image disappears, the image may be dark. This is not problem for monitor reliability. Readjust to gain the best position.
-

●Before Returning to the Owner :

To protect your customers, perform the following safety checks before returning the monitor.

A. Observance

WARNING

- 1) Testing equipment should be isolated by putting an insulating board in between.

When the back cabinet of the monitor is removed and the monitor is operating, there is a risk of an electric shock.

- 2) Keep people away during the test.

When the back cabinet of the monitor is removed and the monitor is operating, there is a risk of an electric shock.

- 3) Do not wear any metal or accessories.

There is a risk of an electric shock when the circuit is shorted.

B. Test Procedure

DANGER

When any portion of the chassis is short-circuit caused by a leakage of primary voltage line, the conductive area may become high voltage which can result in an electric shock or other hazardous danger.

- 1) Withstanding Voltage Check

Impress AC voltage between a conductive chassis and the line of the AC cord for 1~2 seconds when the Main Power Switch is ON. The buzzer of the testing equipment should not be NG.

100~120V: 1200 VAC (Electric current sensitivity: 5mA)

C. Safety Checks

- 1) Check and see that all the connectors are tightly inserted.
 - 2) Check and see that all the harness wires have been clamped as specified.
 - 3) Check and see that any lead wires are not caught between the chassis and other metal parts in the monitor.
 - 4) Check and see if the following important works for safety are surely performed.
 - The VR721 (HV ADJ), VR711 (X-Pro) is surely locked with the silicone rubber after adjusting.
 - The Anode Cap and the Anode Rings are surely equipped.
 - 5) Check and see if the following important indications for safety are surely indicated.
 - The Label-HV is surely indicated near the anode of FBT, the Focus and Screen Lead, the DY Lead and the anode of CRT.
 - The Name Plate is surely put on the chassis.
 - The Label-HV-Fuse, the Label-DHHS and the Label-PTB-2932 are surely indicated on the CRT or the chassis.
-

SECTION I : SPECIFICATIONS

1. CRT SPECIFICATIONS

Type	A68LBT696X
Trio Pitch	Horizontal: 0.8 mm (Center), 0.9 mm (Edges) Vertical: 0.6 mm
CRT Surface	Anti-Static Coating
Light Transmission	49.0 % approx.
Surface induced voltage	Less than 1.5 kV within 8 seconds after power SW on.

1-1 Limitation of M.P.D.(Missing Phosphor Dots) for CRT

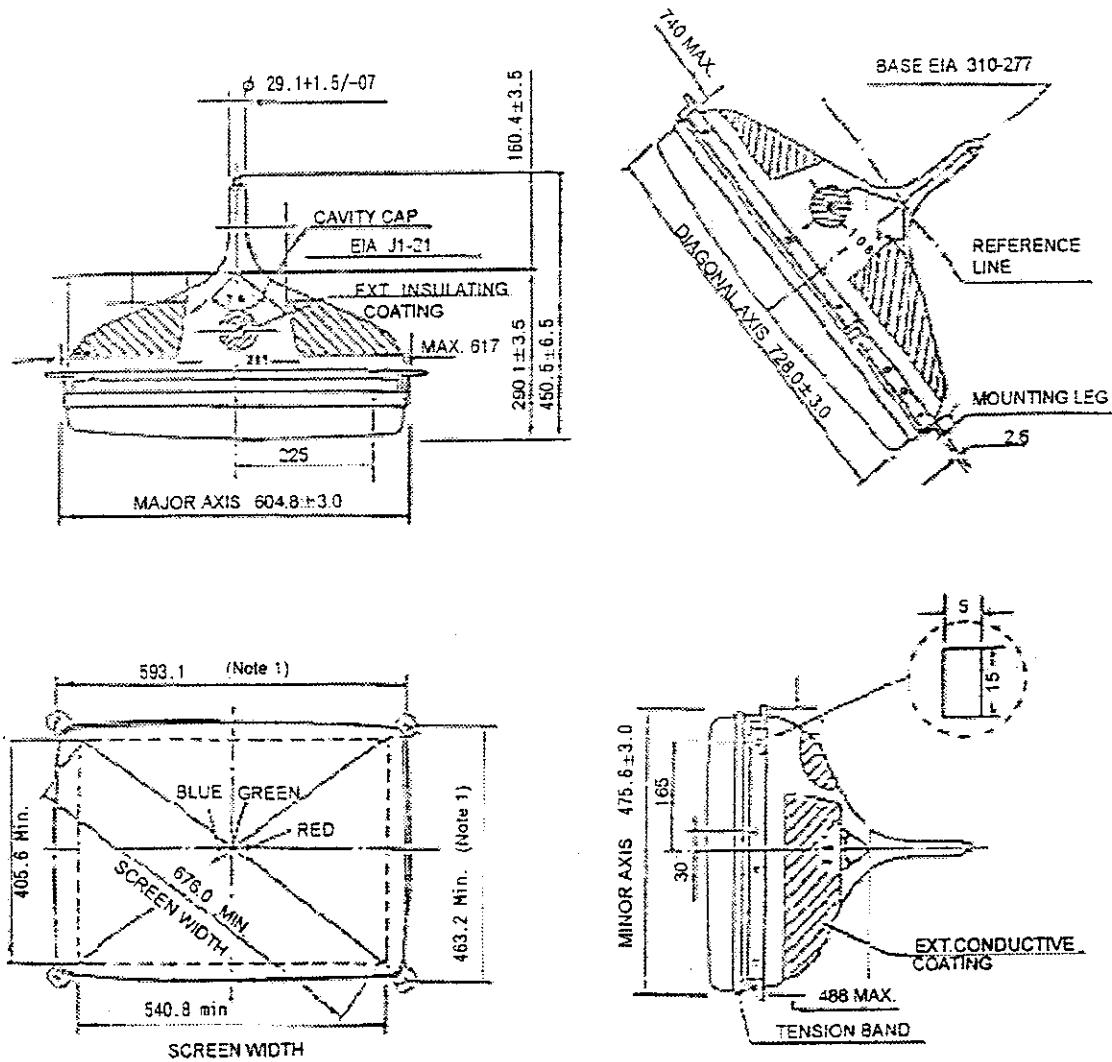

This limitation of M.P.D is applied to the effective screen (phosphor area). In the other screen area, limited are no other defects than scratches preventing the anti-static effective in aluminum foil taped area.

Width (mm)	Max. Length (mm)
less than 0.05	No limit
0.06~0.13	50
0.14~0.20	19
more than 0.21	-

1-2 CRT Dimension

A68LBT696X

Unit: mm

Curvature of the screen

Diagonal: R2390

Horizontal: R2400

Vertical: R2440

2. ELECTRICAL SPECIFICATIONS

All measurements are subject to the conditions below, unless otherwise specified.

Input signal	Mode 1: 15.74kHz, ST-V GOLDEN AXE THE DUAL supplied by SEGA Mode 2: 24.39 kHz, Model 3 (24k) supplied by SEGA Mode 3: 31.67 kHz, Model 3 (31k) supplied by SEGA Refer to 2.5 "Recommended signal timing chart".
Brightness	33% window pattern : 60 ft-L, white field pattern : 32 ft-L, black field pattern: 0 ft-L
Magnetic field	BH : 30µT, BV : 35µT
Measurement	After warm up for at least 30 minutes
Display area size	540 mm x 405 mm
Ambient temperature	20 C°~ 30 C°
Setting conditions	TV style The screen faces the east and the adjustment volumes and switches are in default settings, unless otherwise specified.

2.1 Deflection

Items	Values	Conditions
Scanning Frequency	Horizontal: Mode 1: 15.75 kHz ± 300Hz Mode 2: 24.4 kHz ± 500Hz Mode 3: 31.5 kHz ± 500Hz Vertical: 55 ~ 65 Hz	
Retrace Time	Horizontal: Mode 1, 2: 6.0 µs max. Mode 3: 5.0 µs max. Vertical: 1.0 ms max.	
Linearity	Horizontal: ± 10 % max. Vertical: ± 8 % max.	To be measured with Cross-hatch pattern As obtained through following formula. $H = \{(X_{\text{max. or min.}} - X_{\text{Ave.}}) / (X_{\text{Ave.}})\} \times 100$ $V = \{(Y_{\text{max. or min.}} - Y_{\text{Ave.}}) / (Y_{\text{Ave.}})\} \times 100$
Display area size, position	According to 2.7 Adjustment specifications	
Valid display area size	540 mm x 405 mm	
Display ability	Full scan the recommended timing shown 2.6	
Distortion	(a) Trapezoidal: 3.0 % max. (b) Barrel/Pincushion: 3.0 % max. (c) Tilt: 2° max.	To be measured based on JIS-C6101

2.2 Display

Items	Values	Condition
Center Resolution	676 dots x 676 lines	As obtained through following formula. Center Resolution = Display area size / Center phosphor pitch
Video Bandwidth	28.4 MHz typ. (at -3dB)	

2.3 ITC Performance

Items	Values	Condition
Color Purity	Conspicuous different colors shall not be recognizable with Red-field pattern against all directions after the internal degaussing.	To be degaussed in each direction.
Convergence	Max. deviation among RGB raster line center distances, either horizontal or vertical, shall not exceed the following: <ul style="list-style-type: none"> • Within a circle whose diameter is equivalent to 60 % of V. length of CRT: 1.5 mm max. • Within a circle whose diameter is equivalent to vertical length of CRT (excluding the above circle): 2.5 mm max. • Within CRT screen (excluding the above circles) : 3.0 mm max. 	
Jitters	To be invisible from the distance of 50 cm from CRT surface.	
White Balance	x : 0.285 ± 0.02 y : 0.285 ± 0.02 Color Temperature 9700K approx.	To be measured at center of a white-window pattern with Bright VR and Contrast VR in adjusted settings.
Focus	To be adjusted best.	
Maximum brightness	60 ± 10 ft-L	Input signal 0.7 Vp-p To be measured with a white field pattern.

2.4 Power Supply

Items	Values	Condition
Input current and voltage	100-120 VAC ± 10 %, 50/60 Hz	
In-rush current	72 A peak max.	At 132 VAC
Power Consumption	120 ± 18 W	To be measured in default settings with a white field pattern. (The CONTRAST VR is Max.)

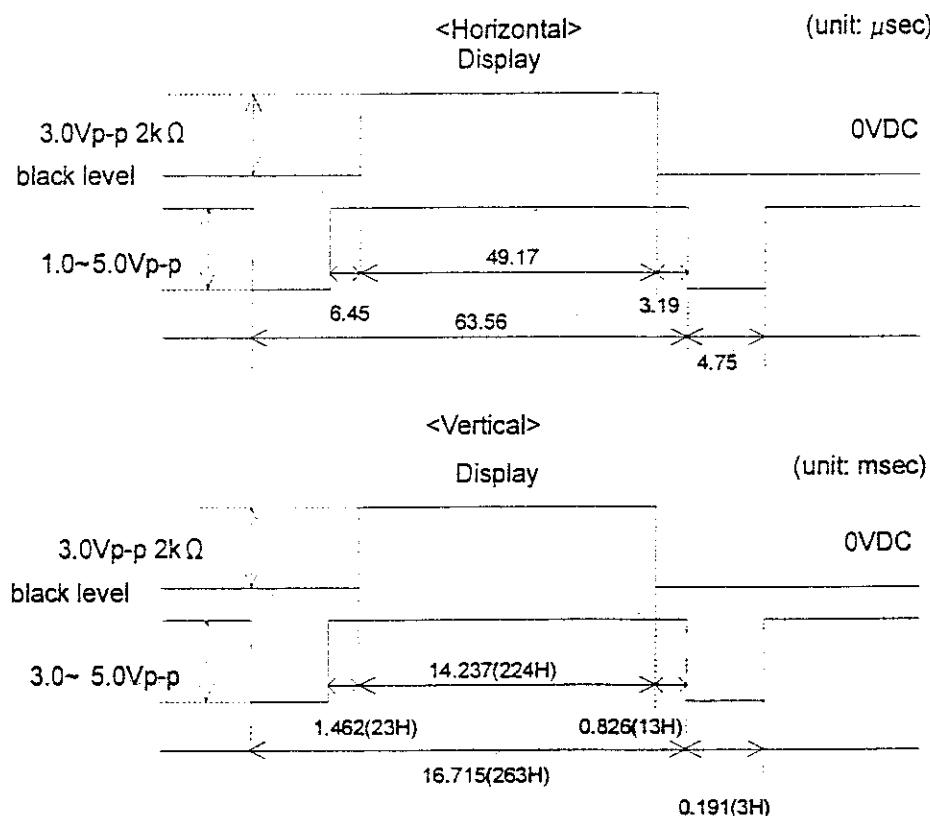

2.5 Signal Input

Sync Input Signal Form	(a) H/V Separate, Positive/Negative (b) H/V Composite, Negative
Video Input Signal Form	AMP UP: analogue, Positive, 3 Vp-p/2kΩ D-Sub : analogue, Positive, 0.7 Vp-p/75Ω
Scanning	Non-Interlace

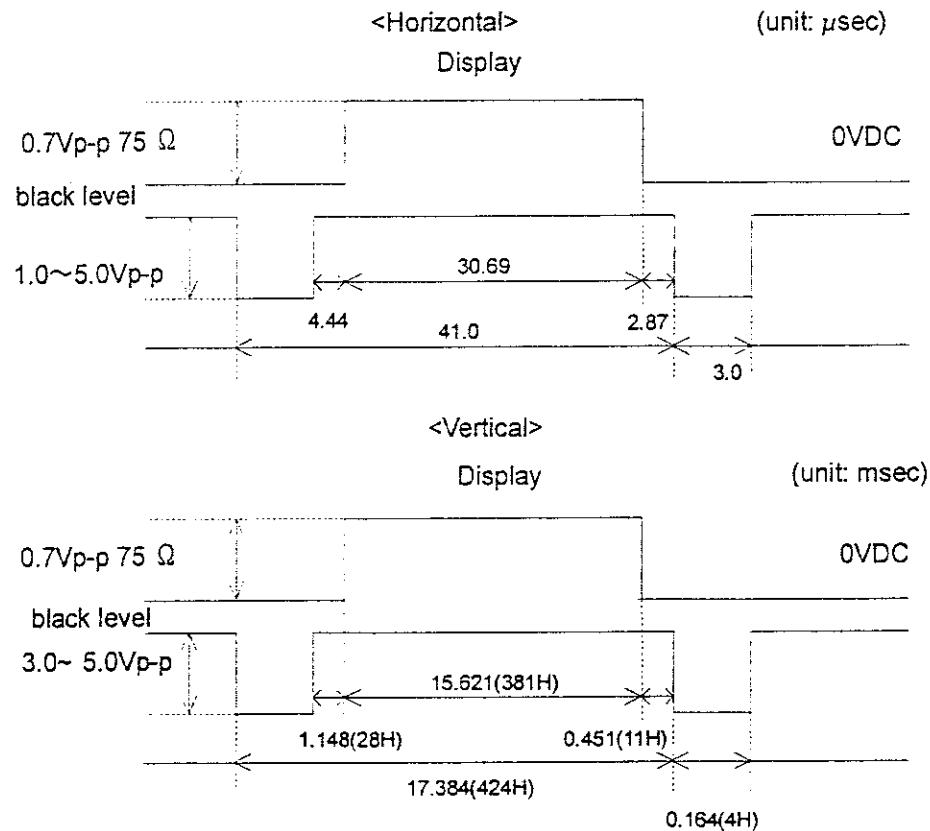

2.6 Recommended Signal Timing Chart

Mode 1

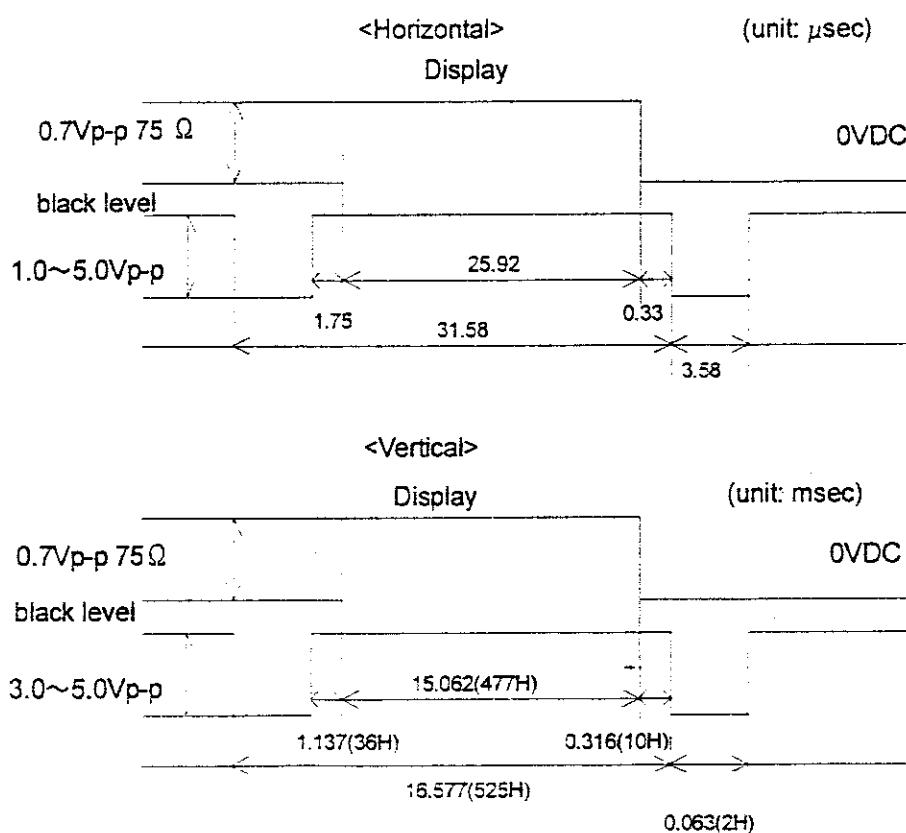

At 15.734 kHz

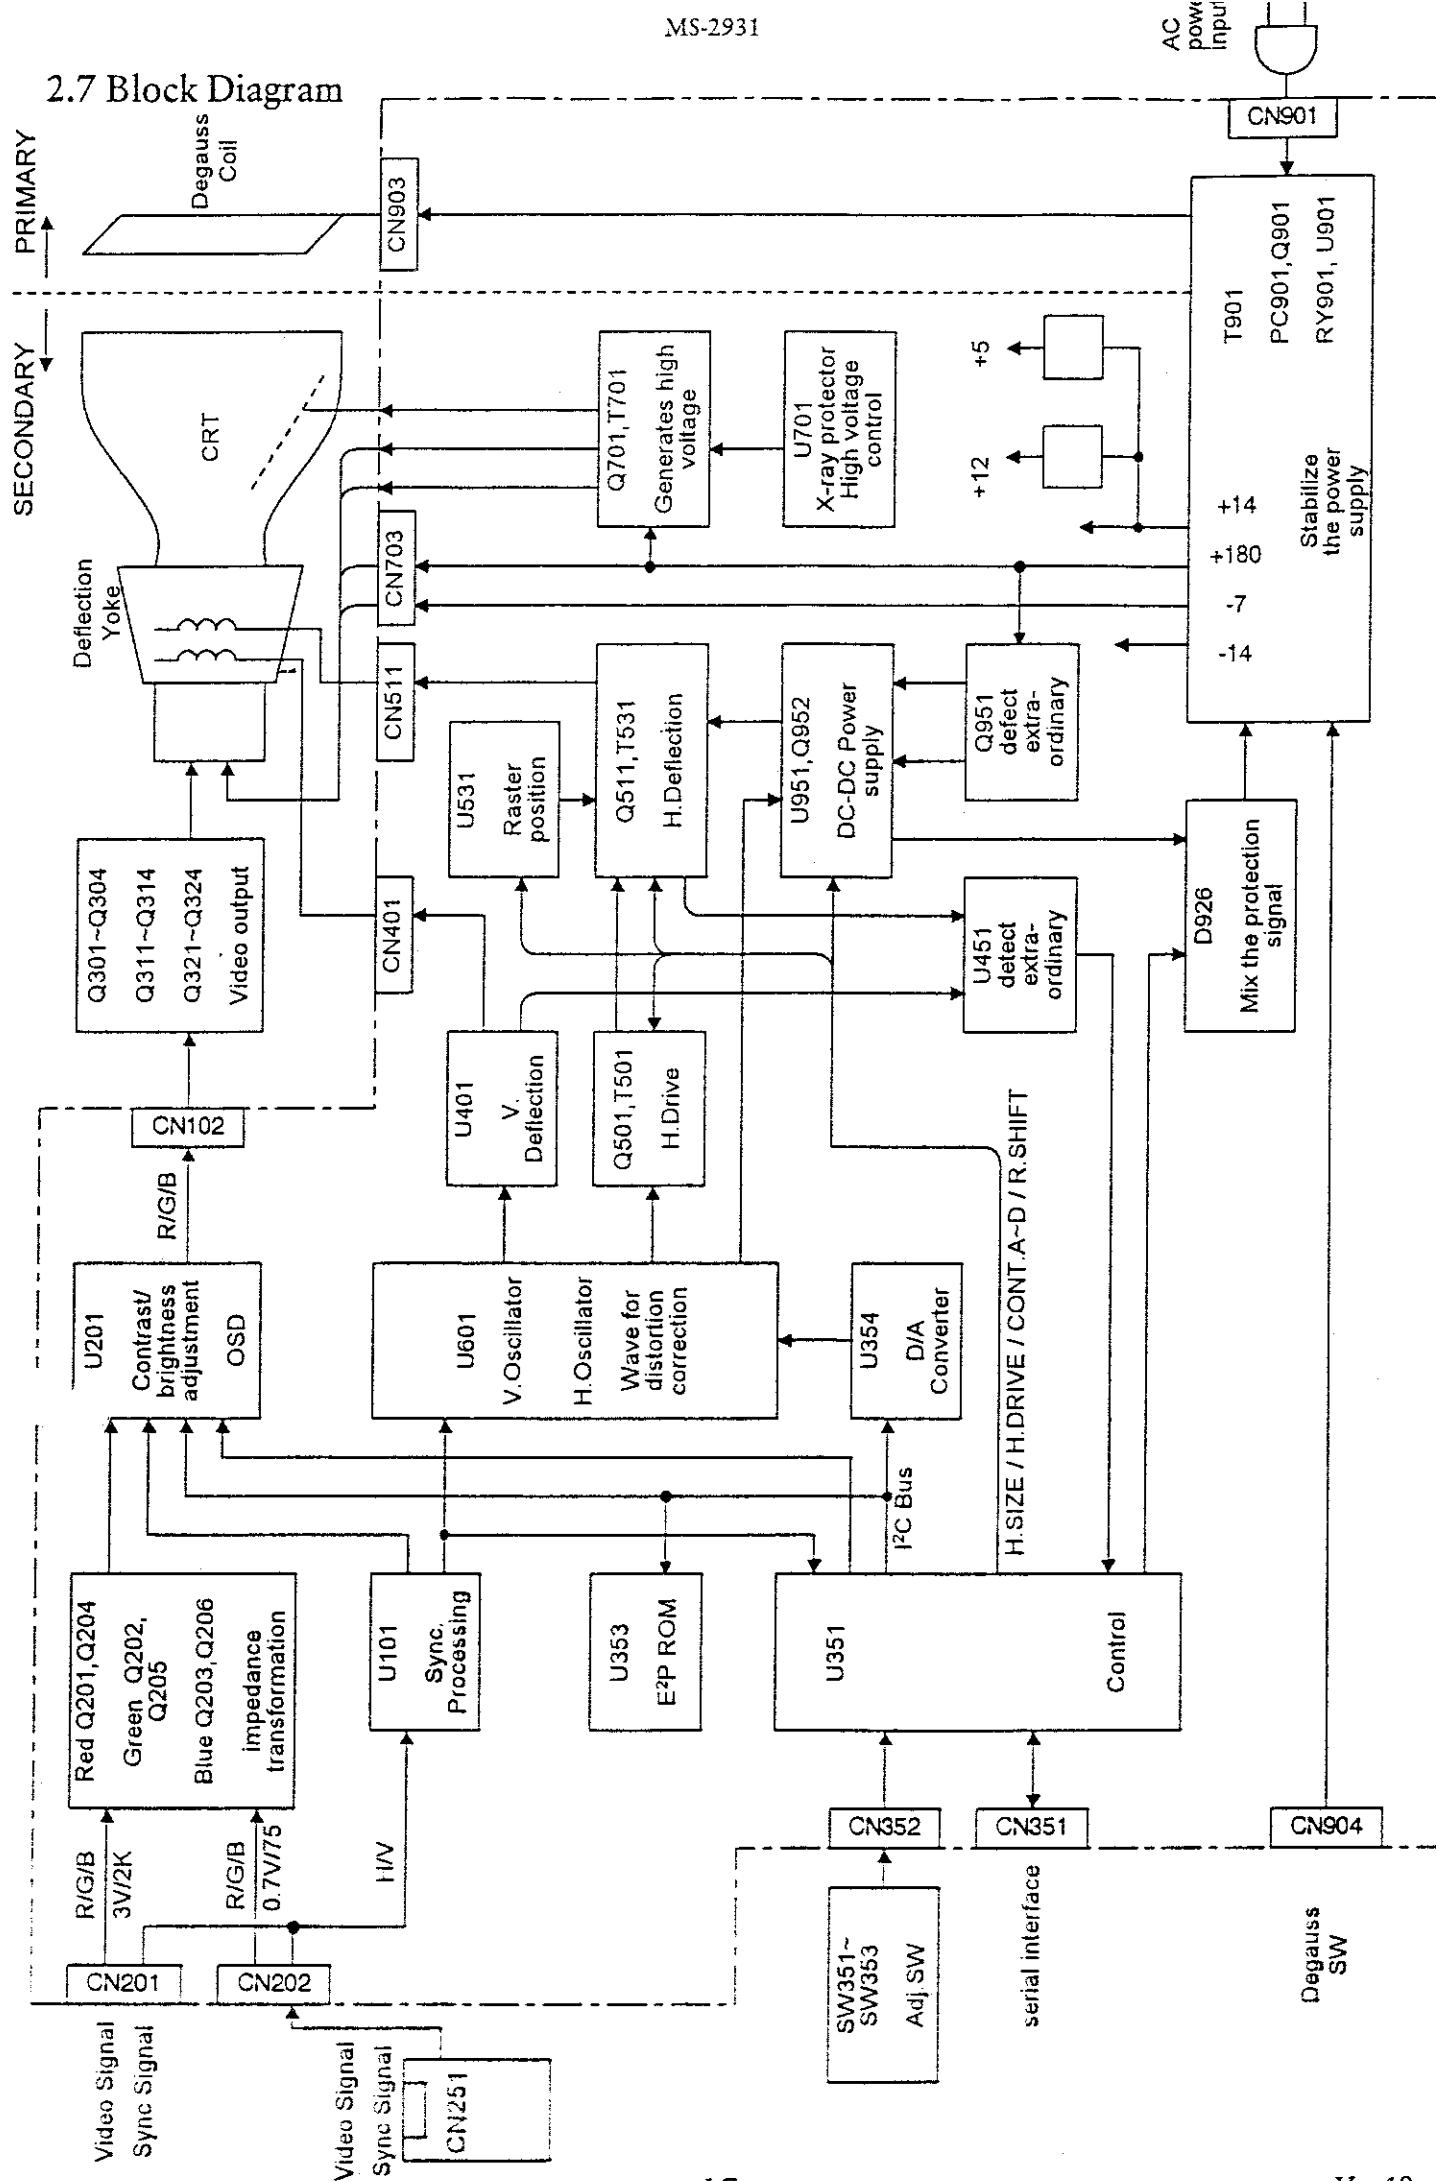

Mode 2
At 24.39 kHz

Mode 3
At 31.67 kHz

2.7 Block Diagram

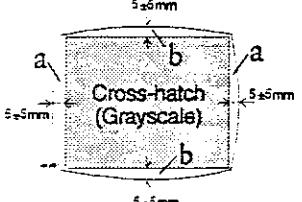

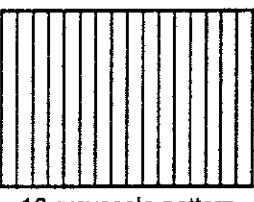

2.8 Adjustment Specifications

2.8.1 Standard signal used for the adjustment

Use the following 3 modes.

- 1) Mode 1: ST-V GOLDEN AXE THE DUAL supplied by SEGA
- 2) Mode 2: Model 3 (24k) supplied by SEGA
- 3) Mode 3: Model 3 (31k) supplied by SEGA

2.8.2 Adjustment Specifications

Items	Values	Conditions
Display Area 	a. Horizontal edges : 5 ± 5 mm b. Vertical edges: 5 ± 5 mm	The screen shall face the east.
Scan Direction	The scanning shall start from left top corner when the monitor is set to face its anode button top.	
Display Position	To be centered.	
White Balance  16 grayscale pattern	Conspicuous different white balance shall not be recognizable in low and high brightness part with 16 grayscale pattern. Low brightness level (1 st gradation part) : 0	
Others	100% scanned in each signal. No extraordinary in each pattern.	

3. MECHANICAL SPECIFICATIONS

3.1 Adjustment Functions (Please refer to Section III for the detail.)

3.1.1 PCB-SW The Function Key adjustment (OSD: On Screen Display)

- Vertical Position Adjustment (V.POSI)
- Horizontal Position Adjustment (H.POSI)
- Vertical Size Adjustment (V.SIZE)
- Horizontal Size Adjustment (H.SIZE)
- Contrast Adjustment (CONTRAST)
- Brightness Adjustment (BRIGHT)
- Degaussing function (DEGAUSS)
- Reset (RESET)

3.1.2 PCB-MAIN

- Switching the polarity of Deflection Yoke
- Focus Adjustment (FOCUS)

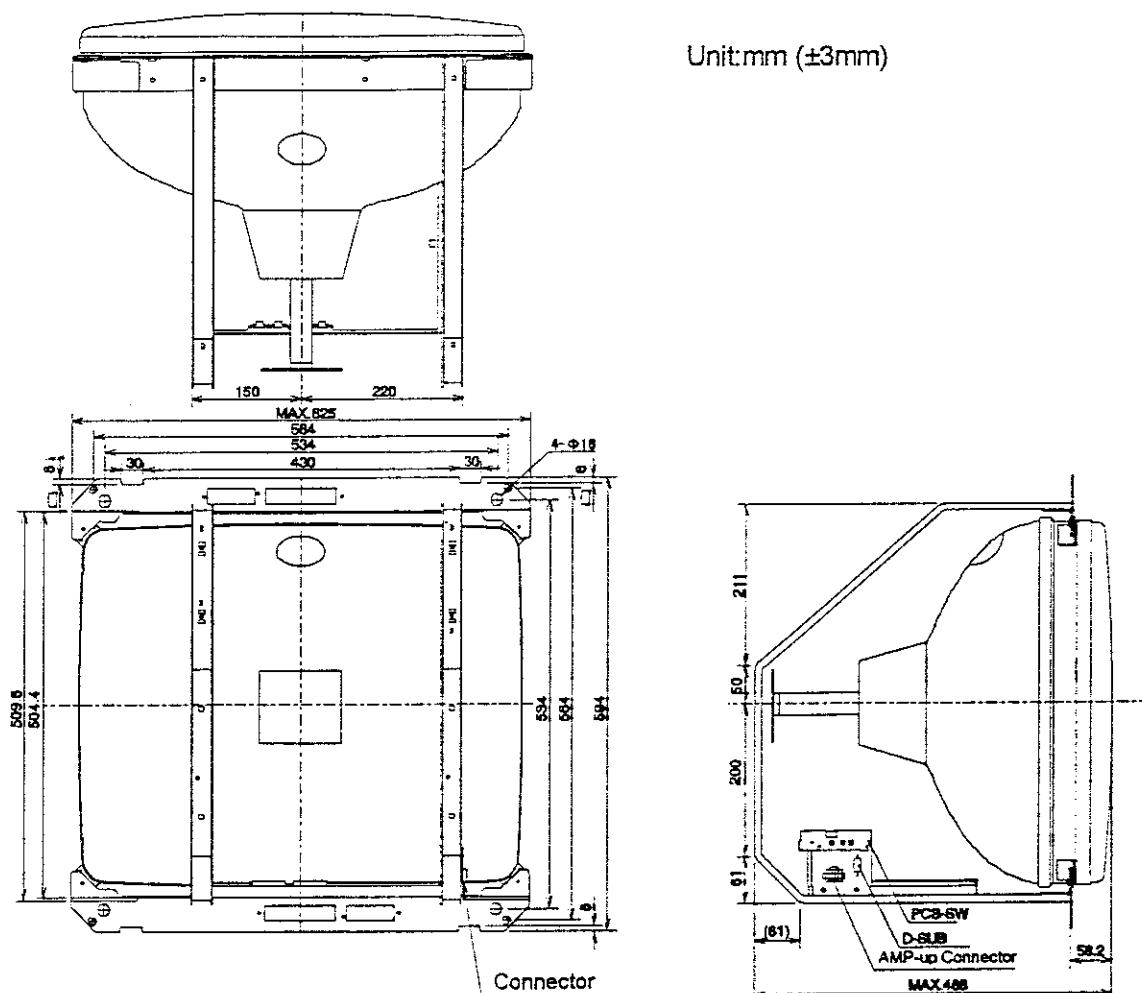

Do not adjust above volumes except the authorized service personnel.

3.2 Configuration

NOTE: All of the dimensions, weights and angles below are reference values.

Dimensions (net)	625 mm (W) x 594 mm (H) x 488 mm (D)
Weight (net)	approx. 40.0 kg
Outline drawing	Refer to the below.

DHHS (DNHW)					✓ (X-ray)	
PTB*					✓ (X-ray)	

4.2 Standards (excluding Video components)

Standard	Category				Marking
	Safety	EMC	Ergonomic	Other	
VCCI Class A		✓			
FCC Class A		✓			

INSTALLATION INSTRUCTION FOR SAFETY REQUIREMENT

The monitor should be installed in following condition in order to meet the requirement of safety standard EN60950: 1992+A1+A2+A3+A4+A11.

1. Power Supply

- a) The transformer which has double or reinforced insulation should be used between primary power source and the monitor.
- b) The rating of input power supply voltage should be 100-120Vac ± 10%.

2. Ambient temperature

The ambient temperature around the monitor should be less than 40°C.

5. RELIABILITY & SAFETY

5.1 Reliability

MTBF	20,000 hours at standard power input excluding CRT. *Values calculated according to the simplified "Parts Count Reliability Prediction" method as specified in MIL-HDBK-217F.
AC line noise resistance	No synchronized condition shall be detected when applying 500Vp-p pulse by using a noise simulator.

5.2 Safety Aspect

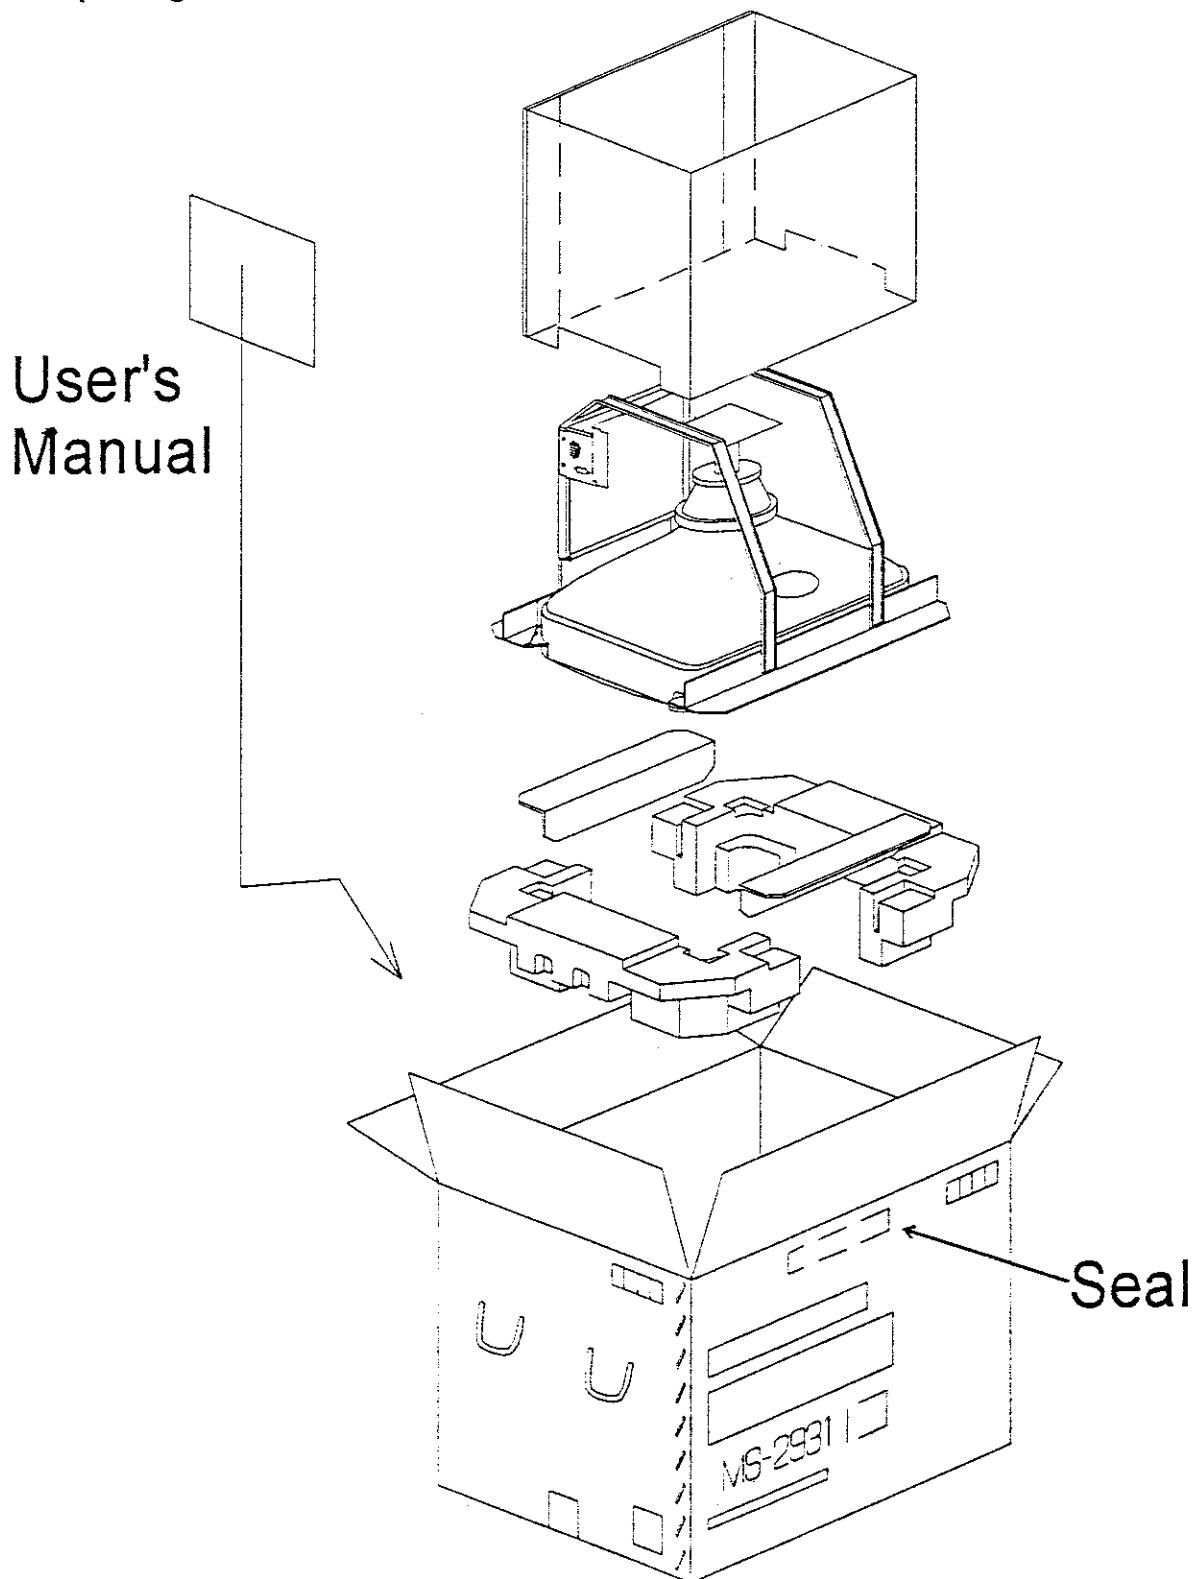

Undesired radiation	Less than 0.1 mR/hour (1 μ Sv/H) at 10 cm distance.
High voltage label	To be pasted on the followings. <ul style="list-style-type: none"> • Top of the anode cap • The anode lead • The focus and screen lead • The DY lead

6. OPERATING ENVIRONMENT SPECIFICATIONS

Ambient Temperature	Operation: 0 °C~40 °C Storage : -10 °C~60 °C (The inner temperature of the amusement machine should be designed below 40°C.)	
Ambient Humidity	Operation: 70 % R.H. max. Non condensing Storage: 80 % R.H. max. Non condensing	
Altitude	Operation: up to 3,000 m Shipping or Storage: up to 12,000 m	
Vibration	(Ass'y chassis unit)	To be free from any damage to the circuits nor the appearance on 1 hour 1 G vibration test to be carried out under 5~100~5 Hz varying frequencies in every 10 minutes. To be validated along all three axes.
	(Face-up)	To be free from any damage to the CRT on 1 hour 0.5 G vibration test to be carried out under 5~100~5 Hz varying frequencies in every 10 minutes. To be validated along the axes of the CRT.
	(Unit package)	To be free from any damage on 30 minutes 1 G vibration test to be carried out under 5~100~5 Hz varying frequencies in every 10 minutes. To be validated along all three axes.
	(Pallet package)	To be free from any damage on 40 minutes (or 1 hour in up-down vibration only) 0.5 G vibration test to be carried out under 5~100~5 Hz varying frequencies in every 10 minutes. To be validated along all three axes.
Drop Test	(Unit package)	To be free from any damage on free drop from 40 cm height once.
	(Pallet package)	To be free from any damage on free drop from 15 cm height and on drop with support (10 cm) from 15 cm height once.

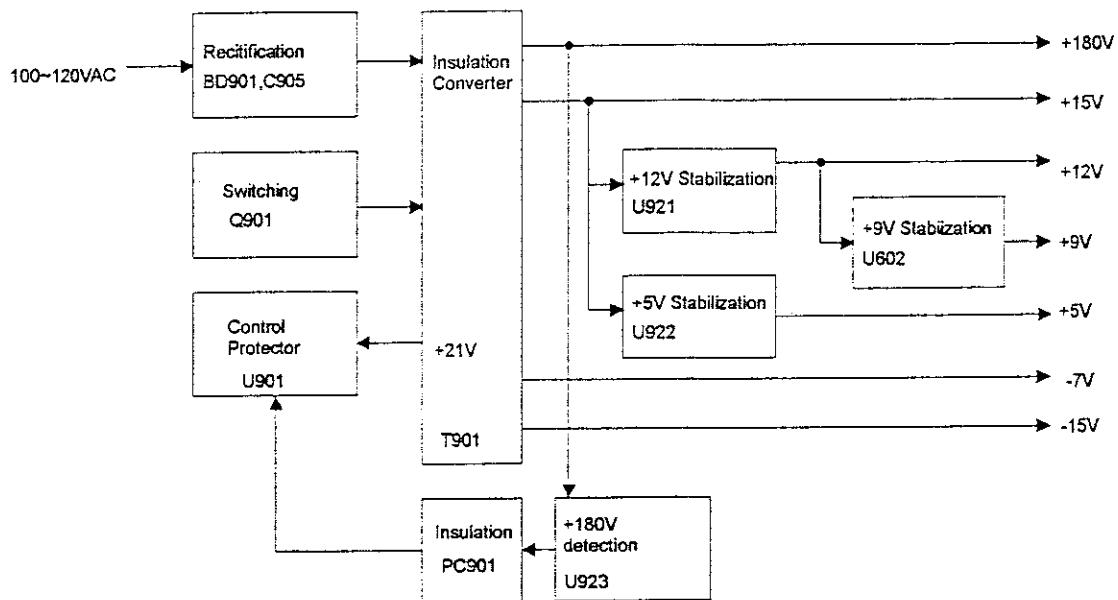

7. PACKAGING SPECIFICATIONS

7.1 Unit package

SECTION II : CIRCUIT DESCRIPTION

1. Power circuit

Power Circuit Block Diagram

This circuit generates insulated and stabilized DC voltage from AC power in order to supply the power for each circuit operation.

The following voltages are supplied to the each circuit.

- +180V: Chopper Power Circuit (Horizontal Deflection, High Voltage generating circuit, Video output circuit(In PCB-CRT))
- +/-15V: Vertical deflection IC (U401)
- +12V: Video amplifier IC (U201) , Chopper Power IC (U951) , High Voltage control IC (U701)
- +9V: Deflection IC (U601)
- +5V: Microprocessor (U351) , EEPROM (U353) , DAC (U354) , Sync. Processing IC (U101) , Video amplifier IC (U201)
- -7V: CRT heater

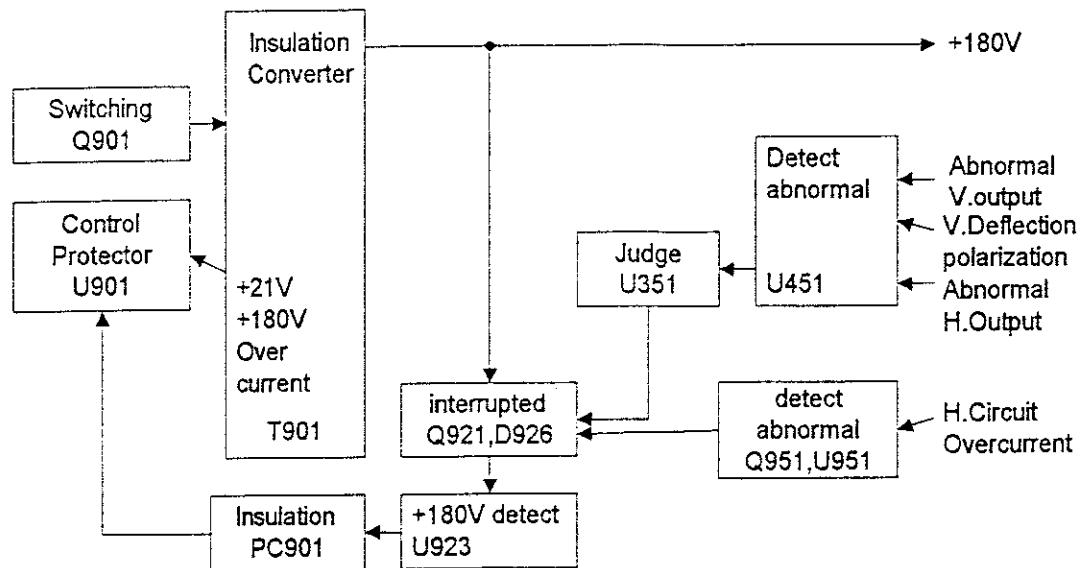

The 180V is stabilized as following order.

- The U923 compares the voltage divided from 180V output and internal standard voltage (2.5V)
- When the divided voltage is higher, the current is run to the PC901 (photocoupler) and the voltage at U901 9pin is heightened. The inverted amp output, the voltage at U901 8 pin is lowered.
- The current run into SW Q901 is detected at R907 and input to U901 4 pin.
- The U901 controls the pulse width of 1 pin by comparing the trisection voltage of U901 8 pin and

the voltage on 4 pin.

- When the 180V output is higher, the energy stored at T901 is reduced because the ON term of Q901 is shortened. Then the 180V is gone down and stabilized. The other voltages (+15V, -7V, -15V) are proportioned with 180V by the ratio of winding for T901.
- The +12V and +5V are generated from the +15V generated through the 3 terminal regulator. The +9V is generated from the +12V through the 3 terminal regulator.

2. Protection Circuit

Protection circuit Block

The protection circuit stops the circuit when the monitor is abnormal.

There are 3 detected parts.

- The Q901 over-current protector and over voltage protector by U901.
- The detection of abnormal vertical and horizontal deflection by U451
- The overcorrect detection of horizontal deflection circuit by Q951 and U951.

When the voltage on U901 7 pin exceeds the 4V, the pulse output from 1-pin stops and the power circuit operation stops. The over voltage/current is detected as follows:

- The 180V gets over voltage (about 220V) → The voltage on C910 gets higher. → The D901 conducted → The voltage on U901 7 pin gets 4V. → The pulse on U901 1 pin disappears.
- The over-current (10A peak) runs at Q901. → The R907 detects over-current. → The peak voltage on U901 2 pin gets 0.2V. → The charging current runs to C915 from U901 7 pin. → The voltage on U901 7 pin gets 4V. → The pulse on U901 1pin disappear.

The U451 detects the following 3 extraordinariness.

- (1): The voltage on U451 5pin (to detect the extraordinary of vertical output)
- (2): The voltage on U451 3 pin and 6 pin (to detect the polarization for vertical deflection current)
- (3): The voltage on U451 2 pin (to detect the extraordinary for horizontal output)

When they are at normal, the voltages are as (1) > (2) > (3) . The output of U451 1 pin and 7 pin are at high level. When the boost voltage disappears at U401 (vertical deflection IC, the voltages are (1) > (2). The output of U451 7 pin gets low level.

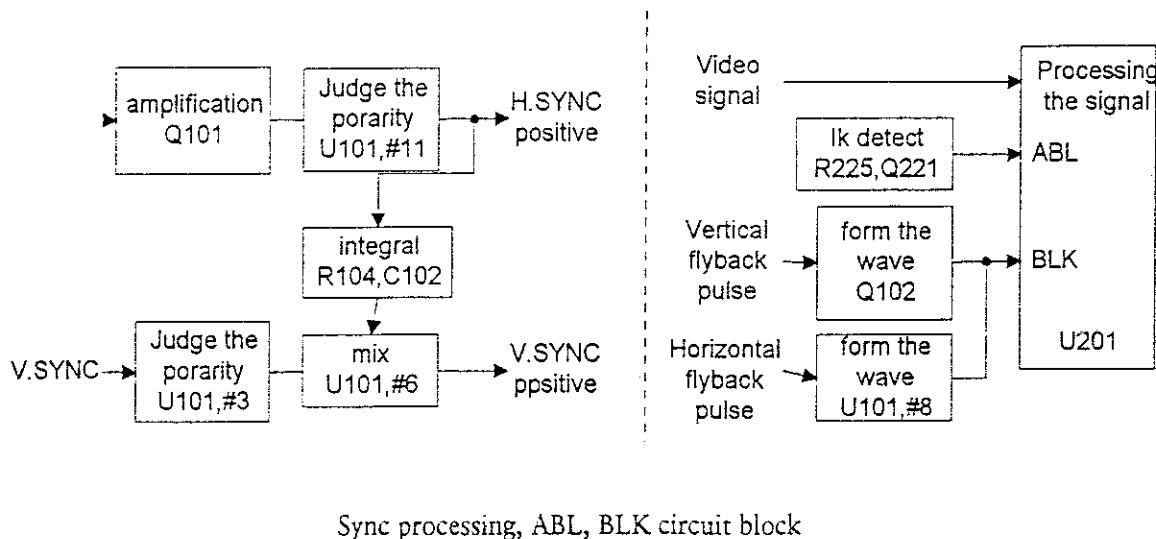

When the collector pulse of horizontal output disappears, the voltage gets (3) > (2) and the output of

U451 1pin gets low level

The output from U451 1 pin and 7 pin are input to the U351 27pin (microprocessor). The input stays at low level for 3 seconds, the HIGH is output from 26 pin of U351. Then the Q921 turns on and the 180V get over voltage with turning Q921 ON.

The Q951 detects the over-current of horizontal deflection circuit. When the over-current runs, the Q951 turns ON and charges the C957 connected to the U951 7 pin. When it reaches to 5V, the HIGH voltage output from U951 6pin. Then the Q921 turns on and the 180V get over voltage.

3. Sync Processing, ABL, and Blanking (BLK) circuit

The Sync.processing circuit converts the signal to positive and separate sync. signal to corresponds the composite/separate , positive/negative of the sync.signal.

The Q101 amplifies the sync of 5Vp-p.

The U101 12 pin to 11pin and 1 pin to 3 pin judges the polarity and output the positive C/H.Sync to 11 pin and positive V.Sync is output to 3 pin..

At the composite sync input, the V Sync is output from U101 6 pin divided by the integral. At the separate sync input, the V.SYNC same as the input to monitor (converted positive).

The sync signal is send to the U351 (microprocessor) and U601 (deflection IC). It is used to detect the input frequency at U351. At U601, it is used to synchronize the oscillation.

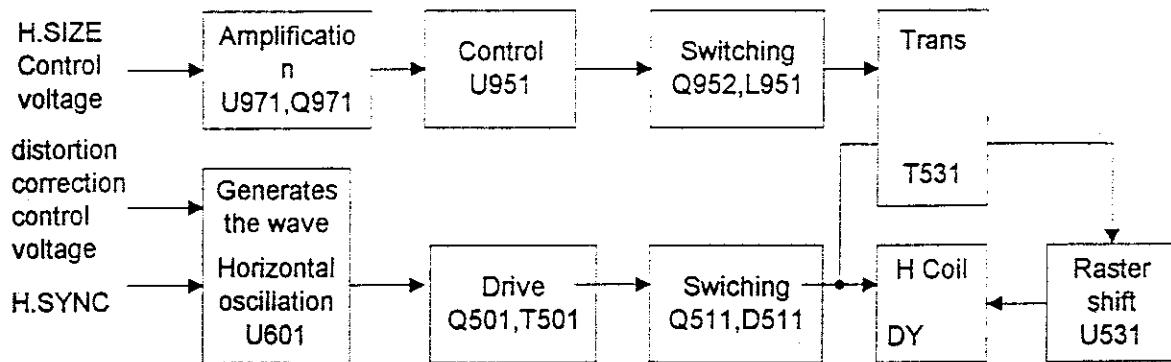

The ABL control the average current of CRT cathode to prevent the over-current to CRT. The current to the CRT runs through R225, R731, T701 8 pin and T701 HV terminal.

It detects the average current to the CRT due to the voltage descent of R225 ($I_k = 1.3mA$) and controls the voltage on U201 27 pin.

When the voltage on U201 27 pin gets higher, the amplification degree gets smaller. As a result, the contrast gets poor and the average current of CRT cathode is controlled.

The BLK circuit prevents the flying back electron beam luminescent to reflect to phosphor. The BLK pulse is generated by the pulse generated in the fly-back term if horizontal/vertical deflection. The vertical BLK pulse formed at Q102 and horizontal BLK pulse formed at U101 9 pin to 8 pin are mixed and supplied to U201 16 pin. The video signal is blanked in the U201.

4.Horizontal Deflection Circuit

Horizontal Deflection Circuit block

These circuit runs the saw-tooth shape current (about 10Ap-p) at the horizontal coil of DY to scan the CRT electron beams right and left.

The horizontal deflection

The horizontal deflection is performed as follows:

- The U610 18pin outputs the H.Drive pulse. This pulse is synchronized with AFC by the H.Sync input to the U206 26 pin and FBP input to U601 18 pin. The H.Posotion (H.POSI) and parallelogram distortion (PARA) and the balance adjustment (BALANCE) are performed.
- It drives Q511 by converting to current at T501.
- When the Q511 turns on, the current runs to Deflection Yoke increased straightly.
- When the Q511turns OFF, the magnetic energy stored at the deflection Yoke resonant to the capacitor (C511~C514). The current inverses with cosine curve.
- The D511 conducts at the inverting the polarity. Then the resonant stops and the straightly increased current runs. By turning on the Q511 again before the current reach to zero, the current continues to increase straightly after the polarity goes back. Thus, the saw-tooth wave runs to the deflection Yoke.

The drive current of Q511 requires adjusting. When the Q511 is replaced the VR501 requires adjustment in order the voltage of CN951 get minimum level at the condition of fH=31kHz, H.SIZE=MIN.

The Q502 adjusts the drive current according to the H.Size. More current runs to Q502 when the H.Size is enlarged. The RY512 turns On at fH=24kHz and fH=15kHz. The RY513 turns On at fH=15kHz. Thus the linearity variation is corrected. The U531 adjusts the raster position. When ITC is adjusted due to the CRT or DY replacement, the raster position is changed. Then the R.Shift must be readjust in order the raster comes to the center of the CRT at the condition of fH=31kHz and raster appears (by the BRIGHT or SCREEN).

The horizontal size adjustment and raster distortion adjustment.

The H.Size adjustment and raster distortion adjustment is by controlling the horizontal deflection

circuit voltage.

The horizontal size adjustment is performed as follows:

- The U351 (microprocessor) sends to H.SIZE data to U354 (DAC).
- The H.Size voltage runs through U354 5pin, U971 5pin, 7pin and Q971. At the Q971, the current runs proportioned to the voltage on U354 5 pin. The voltage on U971 1pin and U951 12 pin are higher proportioned to the Q971 current.
- The U951 controls the horizontal deflection circuit voltage (the voltage on C953) in order to be proportioned to the voltage on U951 12 pin. This means that the low term of U951 1 pin pulse gets short when the voltage on 11 pin gets high (C953 voltage). Then the ON term of Q952 gets short and the output keeps fixed level with going down the voltage on C953.

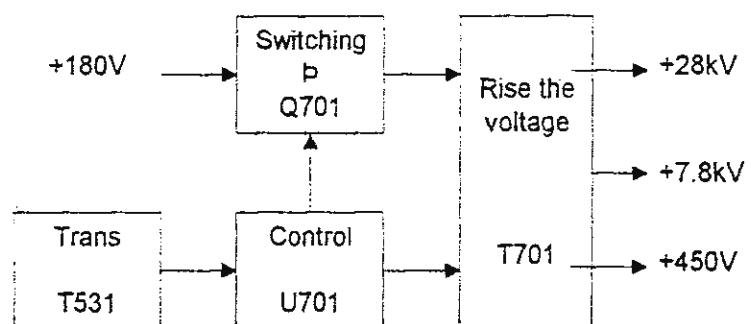

The voltage of horizontal deflection circuit is different according to the horizontal frequency and horizontal size. It is about 45 V at fH=15kHz, about 70V at fH=24kHz and about 90V at fH=31kHz.

The raster distortion correction is performed as follows:

- The data for distortion correction sends to U354 (DAC) from the U351 (microprocessor).
- The U354 send to the control voltage for the CORNER, TRAPE and SPC distortion correction to U601.

The U601 10 pin outputs the each correction mixed wave. The U971 2 pin superimposes to horizontal size adjustment voltage.

5.High Voltage Circuit block

High voltage circuit block

This circuit supplies the high voltage to the each electrode for the operation of the CRT. This circuit supplies 28 kV to the CRT anode, 7.8 kV to focus electrode and about 450V to the G2 electrode. When the pulse (about 10Vp-p) is input to the U701 4pin from the horizontal deflection circuit, the triggered pulse is output from U701 1pin and the high voltage circuit operates.

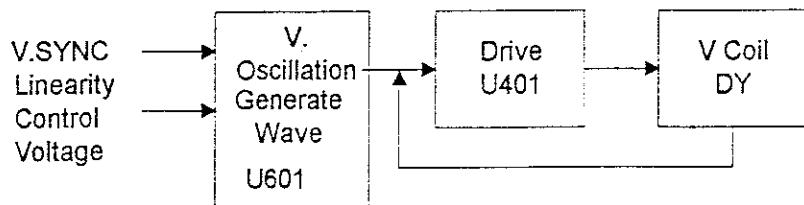

The high voltage is stabilized as follows:

- The voltage parted from high voltage is inputs to U701 6 pin from T701 11pin.
- The drive pulse is output from the U701 1pin. When the input voltage to 6 pin (high voltage) gets high level, the ON term gets short.
- Then, the energy stored at T701 is decreased and the high voltage is gone down. Thus, the high voltage keeps its level.

The X-ray protection is performed as follows:

- This circuit gets the voltage proportioned to the high voltage from the tertiary winding voltage of T701 (FBT).
- The protector operates when the voltage on U701 10 pin becomes 2.35V.
- The voltage on C711 is 24.05 V when the high voltage is 31.5kV. In order to the protector operation of such case, the VR711 has been adjusted and locked with silicone.

6. Vertical Deflection Circuit

Vertical Deflection Circuit Block

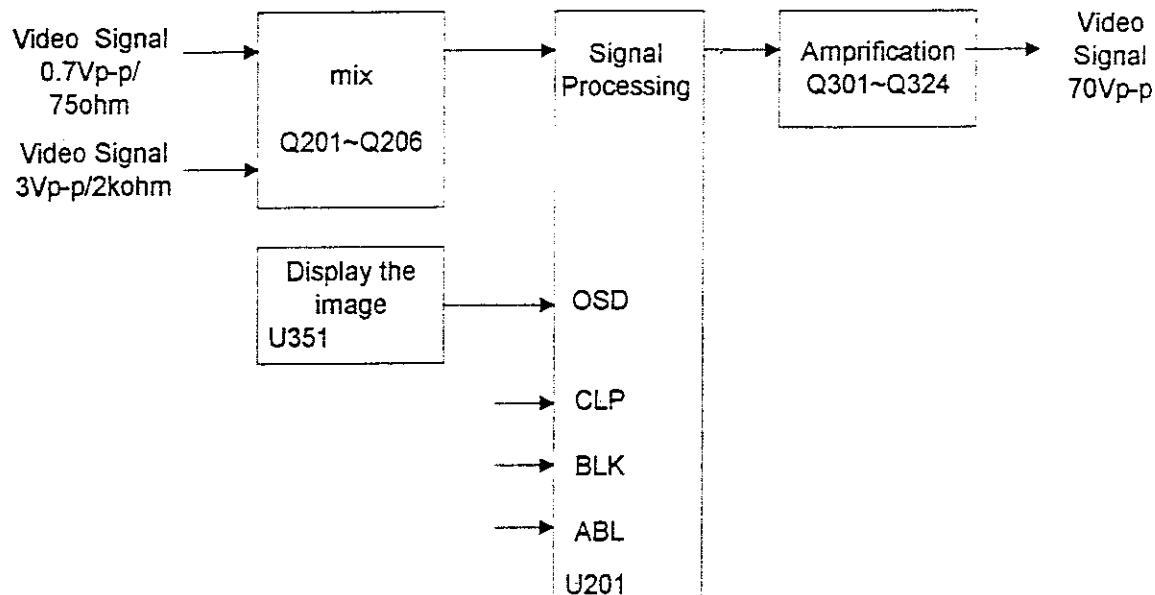

This circuit runs the saw-tooth shape current (about 1.8Ap-p) to the V.Coil of the DY in order to scan the electron beam vertically.

The saw-tooth voltage (about 2Vp-p) is output from U601 9 pin, which is triggered by the V.SYNC pulse.

The linearity correction signal (V.L.S and V.L.C) transmits to the U601 (deflection IC) through the U351 (microprocessor) and U354 (DAC). It is output from U601 9pin superimposed to the saw-tooth voltage.

The U401 operates as the ope-amp. (The +input is U401 5 pin, the - input is U401 6 pin). This means that the output from U401 3 pin varies so that the wave output from U601 9 pin and the wave converted by the R408 from the current run at DY.

7. Video Amplified Circuit

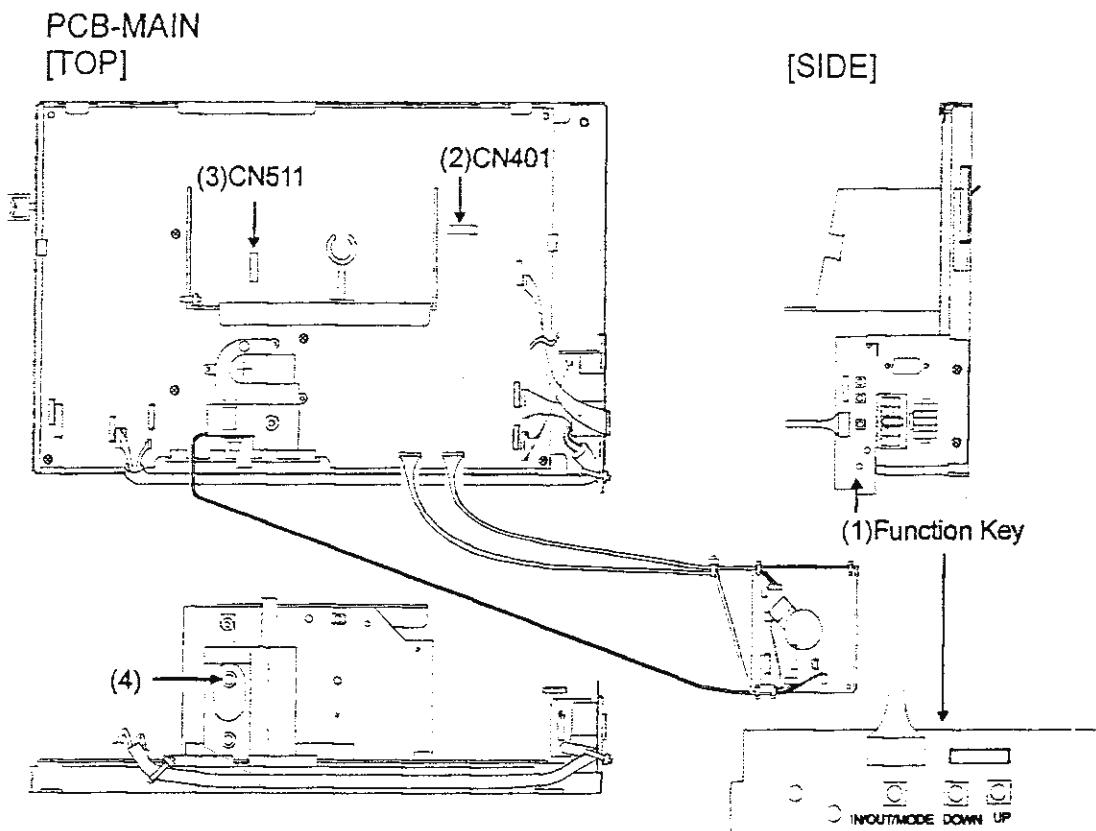

Video Amplified Block

This circuit amplifies 0.7Vp-p/3Vp-p-input signal to about 70Vp-p to gain the sufficient contrast. The input signal 0.7Vp-p/75 Ω or 3Vp-p/2k Ω are united to 0.65 Vp-p amplitude at the mix circuit(Q201-Q206) and supplied to U201.

The U201 treat the amplification, direct-current restoration, switching the OSD signal, Brightness adjustment, contrast adjustment, ABL adjustment and blanking addition. The signal transmitted to PCB-CRT (about 1.6 Vp-p) amplified to about 70Vp-p at Q301-Q324 and supplied to CRT cathode.

III Adjustments and Control

Do not touch any other volumes than the below volumes if not necessary.

- 1 Name**
- (1) Function Key: Display the OSD for screen adjustment
 - (2) The connector to switch the polarity of Deflection Yoke [CN401]
 - (3) The connector to switch the polarity of Deflection Yoke [CN511]
 - (4) FOCUS: Adjusts the focus

2 Adjustment by OSD (On Screen Display)

Use the Function Key (1) (MODE/UP/DOWN button)

● Operation

1. Pressing the MODE button displays the OSD (the right side number indicates input frequency)

Ex) 31kHz input

2. Press MODE button and select the adjustment menu.
(Whenever the MODE button presses, the OSD changes as V-POSI→H-POSI→V.SIZE→H.SIZE→CONTRAST→BRIGHT→DEGAUSS→RESET→OSD menu OFF)

<Note>

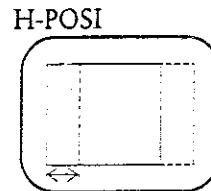

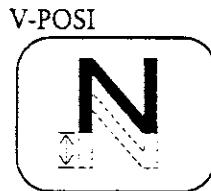

Press the MODE button and DOWN button at same time, the adjustment menu returns to previous menu.

4. Adjust with UP/DOWN buttons.
5. To hide the OSD, repeat pressing the MODE button until the menu is OFF.

- Adjustment Menu

- V-POSI

Adjust the vertical position of image.

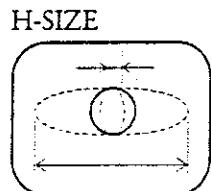

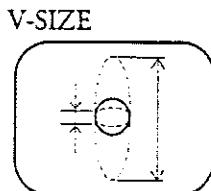

- H-POSI

Adjust the horizontal position of image.

- V-SIZE

Adjust the vertical dimension of the image

- H-SIZE

Adjust the horizontal dimension of the image.

- CONTRAST

Adjust the contrast of the image.

- BRIGHT

Adjust the brightness of the image.

- DEGAUSS

Perform the degauss.

Once degaussing, this function does not work for about 5 minutes. (Please wait until the lower OSD indicates <PLEASE> for the next degauss)

- RESET

The adjustments return to default setting. (Press the UP or DOWN button for a few seconds)

- Store the adjustment data

The proper image is automatically displayed to the 3 type input signal (H.Frequency: 15kHz Mode, 24kHz Mode, 31kHz Mode) as the factory setting. In addition, the user can store the 1 adjustment status to microprocessor in each mode. Therefore, the adjustment once made does not require further adjustment. To return the default setting, perform the <RESET> function at the OSD.

3 Other adjustment

- (2), (3) Switch the polarity of the Deflection Yoke

	CN401 (2) (NORMAL)	④CN401 (2) (REVERSE)
CN511 (3) normal connection		
	Normal Screen	Reversed Screen
CN511 (3) reverse connection		
	Mirrored	180° rotated screen

*CN401 (2)

Q511

Blue Red

CN511

Q511

Red Blue

CN511

- (4) FOCUS

Adjust to get best focus.

4 Special Function

- Auto Switching function the display mode

This model judges the input frequency automatically (H.frequency: 15kHz Mode, 24kHz Mode, 31 kHz Mode) and display the image.

IV Adjustments

1. Factory Adjustments

The factory adjustment uses the OSD appears by pressing the buttons connected to AMP-UP connector through the build-in microprocessor. Enter the factory mode for the factory adjustment.

1-1. Factory adjustment Mode

- (1) To enter the factory mode, press the 3 buttons (MODE, UP, DOWN) at a same time (for 3 seconds) in the normal operation (Without OSD). Press the UP and DOWN button first and then press the MODE button,
 - (2) Whenever the MODE button pressed, the adjustment menu changes. To select the adjustment menu in the reversed order, press the DOWN button with pressing the MODE switch.
-

Please note that the adjustment menu changes continuously by pressing the MODE switch continuously.

- (3) To change the data press the UP/DOWN button in each mode.
- (4) After the adjustment, store the adjustment data in each frequency mode by SAVE.
- (5) Return to Normal mode to end the factory mode. Press the MODE button until the OSD indicates "EXIT". Press the UP or DOWN button for a few seconds to return the normal mode

1-2. Factory adjustment menu

No.	menu	adjustment
1	FH0	horizontal sync check (Free run adjustment)
2	FH0-FINE	Horizontal sync. check (Free run adjustment).
3	R-SHIFT	Horizontal raster adjustment
4	V-LIN-S	Vertical linearity adjustment
5	V-LIN-C	Vertical linearity adjustment
6	V-POSI	Vertical position adjustment
7	H-POSI	Horizontal position adjustment
8	V-LIMIT	Vertical Size Limit adjustment
9	H-LIMIT	Horizontal Size Limit adjustment
10	V-SIZE	Vertical Width adjustment
11	H-SIZE	Horizontal Width adjustment
12	TRAPE	Trapezoidal distortion adjustment
13	PARA	Paralelogram distortion adjustment
14	BALANCE	Side-pin Balance distortion adjustment

No.	menu	adjustment
15	SPC	Side-pin cushion distortion adjustment
16	CORNER	Top/bottom corner distortion adjustment
17	R-CUTOFF	White balance adjustment for dark area
18	G-CUTOFF	White balance adjustment for dark area
19	B-CUTOFF	White balance adjustment for dark area
20	R-GAIN	White balance adjustment for bright area
21	G-GAIN	White balance adjustment for bright area
22	B-GAIN	White balance adjustment for bright area
23	ABL	ABL adjustment
24	C-CENTER	Center brightness adjustment
25	CONTRAST	Do not use. The contrast must be adjusted by C-CENTER
26	BRIGHT	Adjust the brightness
27	COLORCOPY	Store the adjustment data (Copy the adjustment data for R,G and B CUTOFF, R,G and B GAIN, ABL, C-CENTER and BRIGHT to each frequency mode)
28	DEGAUSS	Degaussing
29	SAVE	Store the adjustment data in each frequency mode
30	RESET	Return to the default setting
31	VERSION	Display the version of OSD
32	EXIT	Exit the factory mode

2. General Adjustment

Before starting the general adjustment, the following tools are recommended to do below tuning

- Degaussing Bar
- Electrostatic voltmeter
- Frequency Counter
- Signal generator which has same timing as the standard signal with 0.7Vp-p output, window pattern and white filed pattern
- Brightness meter
- DC Power Supply (more than 25V)
- Diode (Code Number : 00J25833A1, Description:1SS133)

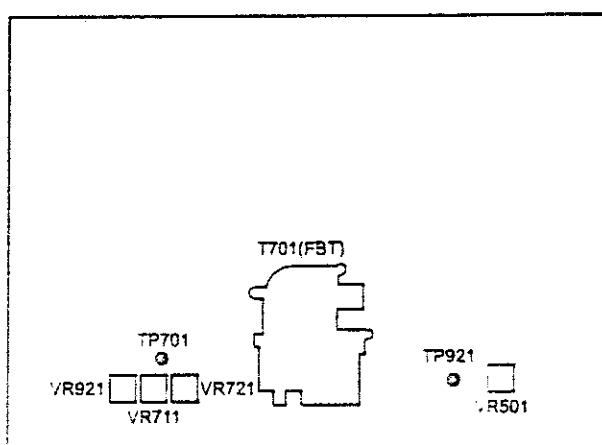

2-1. Signal

ROM No.	No.	Name	Mode	H/V	Frequency	Dotclock	Total	Sync	B.P	Video	Sync polarity	Video Level
1	A	Sega ST-V	15k	H[μs]	15.75kHz	14.32MHz	63.56	4.75	6.45	49.17	Comp Nega	3.0Vp-p 2kΩ
				V[H]	59.82Hz		263	3	23	224

				V[H]	60.32Hz		525	2	44	457		

2-2. Preset

Each adjustment volume must be preset at the following location before powering on except the case it has been adjusted.

No.	PCB	Symbol	name	Preset
1	MAIN	VR921	+B-ADJ	Center
2	↑	VR721	HV-ADJ	↑
3	↑	VR711	X-PRO	Clockwise. Max
4	↑	VR501	H-DRIVE	Counter-Clockwise.
5	↑	T701(FBT)	SCREEN	↑
6	↑	T701(FBT)	FOCUS	Center

<PCB-MAIN---Parts Side>

2-3. Before the adjustment

- Use the signal No.C (Rom No.3) Model 3 (31.6kHz) signal as the standard signal, unless otherwise specified.
- Input voltage should be 100 VAC.
- Connect the GND terminal to the chassis base or the radiator at the center of the PCB-MAIN.
- The CRT and the base should be degaussed.
- Make the pre-heat more than 30 minutes.
- The brightness in heat-running should be set 7 ft-L approx.
- The screen should face the east at adjusting, unless otherwise specified.
- The magnetic field should be set at the Japanese level ($B_V = 0.35G$, $B_H = 0.3G$)

2-4. Adjustments

WARNING

Do not short any position of the circuit while the monitor is in operation.

This will cause smoke, electric shock or damage to transistors, ICs or other parts or circuit in the unit. (Excluding the adjustment only when specified).

Be sure to save in each frequency mode in the adjustment by OSD

(indicated with **OSD** icon)

A. +B. adjustments No signal

Use the +B-ADJ (VR921), adjust to get 180 ± 0.2 VDC at the voltage on TP921.

B. Preset Cross-hatch

Turn the SCREEN VR slowly.

Adjust the SCREEN VR on the FBT so that the back-raster slightly appears. Adjust the FOCUS VR on the FBT to get the best-focused image.

C. Input connector check Signal No. A, B

Switch the input connector and check there are no extraordinary on the screen image.

Video Input Mode	Input connector
Hi : Video $2k\Omega$ termination (EH-6P(AMP 15P) input)	CN201
Lo : Video $75k\Omega$ termination (D-SUB MINI 15P input)	CN251

D. H.Sync. check No signal OSD

- (1) Set the probe of the frequency counter at the DY red lead. Confirm that the free-run frequency shows the following values

(Once input the signal and remove the signal wire, the signal mode is available)

- (1) 15kHz Mode $15.75 \pm 0.1\text{kHz}$
- (2) 24kHz Mode $24.40 \pm 0.1\text{kHz}$
- (3) 31kHz Mode $31.50 \pm 0.1\text{kHz}$

- (2) If they are not in the above range, readjust by fH0 or fH0-FINE at the factory mode.

Please note that, the value of fH0-FINE shows at 128 (middle range) after the adjustment with "fH0".

*Auto adjustment free-run frequency

Press the UP and DOWN button at same time for about 3 seconds with no signal input, the free-run frequency is automatically adjusted in every mode. (For about 15 seconds. requires)

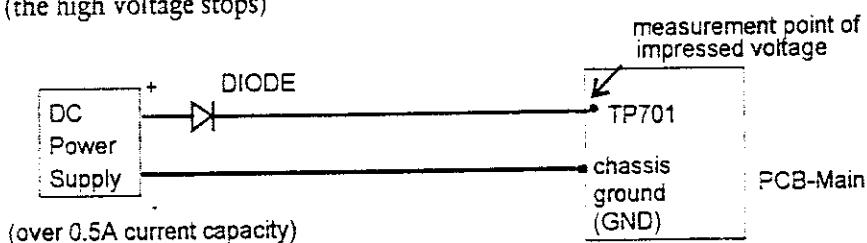

Do not input any signal at the auto adjustment. Otherwise, the adjustment is stopped. (If any signal is input, the OSD shows "FREERUN AGAIN" for 3 seconds.)

E. High Voltage adjustment Cross-hatch Safety important adjustment

- (1) Connect the electrostatic voltmeter at CRT anode.
- (2) With HV-ADJ (VR721), adjust the high voltage to get $28.0 \pm 0.2\text{kV}$.
- (3) After the adjustment seal the HV-ADJ (VR721) with silicone.

F. X ray protector adjustment Cross-hatch Safety important adjustment

- (1) Check the voltage on TP701 shows $21.0 \pm 2.0\text{ V}$ with the X-PRO (VR711).
- (2) Impress $24.05 \pm 0.05\text{V}$ to the TP701 from the DC power supply through the diode (1SS133) to protect DC Power supply. The minus terminal of DC Power supply shall be connected to the chassis ground (GND). (Use the DC Power supply of over 0.5A current capacity.) Turn the X-PRO (VR711) slowly and stops at the position the screen disappears (the high voltage stops)

G. X ray protector confirmation Cross-hatch Safety important adjustment

- (1) Confirm that there is no protector operation when you impress the 23.95V to TP701 from the DC power supply through the diode. (Refer to the figure above)

(2) After the confirmation, seal the X-PRO (VR711) with silicone rubber

H. H drive adjustment (VR501) Cross-hatch

Adjust the VR501 to get the minimum voltage between the terminals of CN951 with the minimum H.Size. Seal the VR501 with the silicone rubber after the adjustment.

Use an extension connector when making adjustment.

I. Screen adjustment (SCREEN) black field OSD

(1) Go into factory mode

(2) Select "BRIGHT" and maximize the value.

(3) Adjust the SCREEN VR (T701) to get 0.8 ± 0.1 ft-L.

(4) Adjust the white balance with "R, B-CUTOFF"

$$\chi : 0.285 \pm 0.015$$

$$y : 0.285 \pm 0.015$$

(5) Repeat the (3) and (4) steps, if necessary.

(6) After the adjustment, disappear the back-raster by using "BRIGHT"

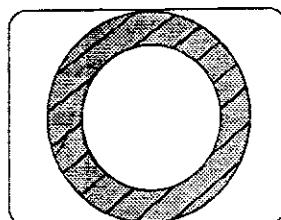

(7) After the adjustment, perform the "COLOR COPY" and copy the data to the each mode.

(Press the UP or DOWN button for a few seconds, the OSD shows "ON" and the "COLOR COPY" is performed.)

Do not touch SCREEN VR after the adjustment.

J. Focus adjustment Cross-hatch

Adjust with FOCUS VR on the FBT to get the best focus in the right part (see the figure)

K. Degauss circuit confirmation..... white field OSD

Confirm that the screen is degaussed with the power ON or "DEGAUSS" of OSD with the magnetized set.

L. H. position adjustment black field OSD

(1) Get into factory mode.

(2) Maximize the "BRIGHT" and set the "H.SIZE" to get under-scanned image.

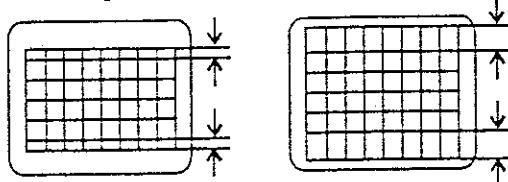

(3) Adjust by using "R-SHIFT" to center the back-raster horizontally.

(The length from raster to bezel is within 1mm)

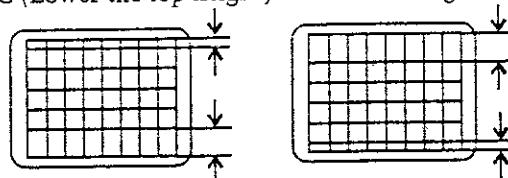

M. V.Linearity adjustment Signal No. A, B, C, Cross-hatch OSD

- (1) Get into factory mode.
- (2) Center the image vertically by using "V-POSI".
- (3) Adjust by using "V-LIN-S" and "V-LIN-C" to get the same width the crosshatch pattern at top and bottom. (Refer to below)

V-LIN-S (The top and bottom heights varies at the same time)

V-LIN-C (Lower the top height, the bottom height is widened. Same as the opposite)

N. Distortion correction Signal No. A, B, C, Cross-hatch OSD

Get into the factory mode and perform the necessary distortion adjustment.

TRAPE: Trapezoidal distortion

PARA: parallelogram distortion

BALANCE: Side-Pin Balance distortion

SPC: Side-pin cushion distortion

CORNER: Top/bottom corner distortion

O. Size/position adjustment Signal No. A, B, C, Cross-hatch OSD

- (1) Get into the factory mode.
- (2) Adjust the Size and position to get the same size of the edge between the image and the CRT Screen by using "H-SIZE", "V-SIZE", "H-POSI" and V-POSI. (The length from raster to bezel is 5 ± 3 mm)

P. H.V Size Limit adjustment Signal No. D, E,F, Cross-hatch OSD

- (1) Get into the factory mode.
- (2) Adjust the Size by using "V-LIMIT" and "H-LIMIT" so that the length from raster to the bezel is equal at top/bottom/right/left corner (The length from raster to bezel is 0 ± 3 mm)

Q. White balance adjustment for dark area Signal No. A, B, C, Black field OSD

(1) Get into the factory mode.

(2) Maximize the "BRIGHT" value.

(3) Adjust the white balance of dark area by using "R-CUTOFF" and "B-CUTOFF"

$$\chi : 0.285 \pm 0.010$$

$$Y : 0.285 \pm 0.010$$

R. BRIGHT adjustment Signal No. A, B, C, black-field OSD

(1) Get into the factory adjustment.

(2) Select the "BRIGHT" and adjust at the position the back-raster disappears.

S. Center brightness adjustment Signal No. A, B, C Window OSD

(1) Get into the factory mode.

(2) Adjust by using "C-CENTER" to get the 60 ± 2 ft-L of white window center brightness

Use the "C-CENTER" only the center brightness adjustment.

T. White balances adjustment for bright area signal No. A, B, C OSD

(1) Get into the factory mode.

(2) Adjust the white balance for bright area by using "R-GAIN" and "B-GAIN".

$$\chi : 0.285 \pm 0.010$$

$$Y : 0.285 \pm 0.010$$

(3) If necessary, repeat the center bright brightness adjustment and white balance adjustment for bright area.

U. ABL Adjustment Signal No. A, B, C, white-field OSD

(1) Get into the factory adjustment mode.

(2) Adjust by using "ABL" to get the 30 ± 1 ft-L of white filed brightness.

V. ITC Adjustment

V-1 Magnetic field

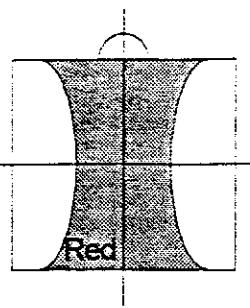

Japanese level. Face the screen the east.

V-2 Preset of the static convergence

Using the degaussing bar, roughly degauss and perform the static convergence adjustment roughly according to the V-4.

V-3 landing adjustment Red field

- (1) Shift the deflection Yoke ahead and rearward to get the best position.
- (2) Hold the deflection Yoke to the CRT funnel (draw forward) and adjust so that the red zone centers horizontally by using 2P magnet.
- (3) Shift the deflection Yoke backward at the position that the entire screen gets red. Fasten with screw with care of the rotation of the screen. Then, fix the deflection Yoke with wedge so that the oscillation of the deflection Yoke centers up/down/right/left. Adjust with blue and green raster. If necessary, perform the fine control.
- (4) Confirm that white uniformity is favorable at the white raster. Rotate the screen to face all direction and confirm that conspicuous different colors shall not recognizable. If any, correct by using the magnet (08R50047A1) on the CRT funnel. After the adjustment, seal it with the silicone rubber (08F08087A1)

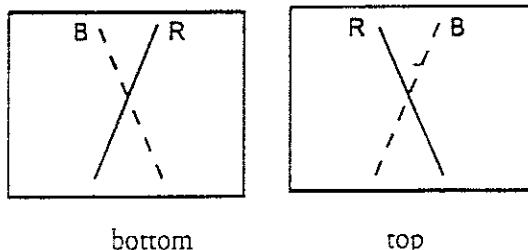

V-4 Static convergence

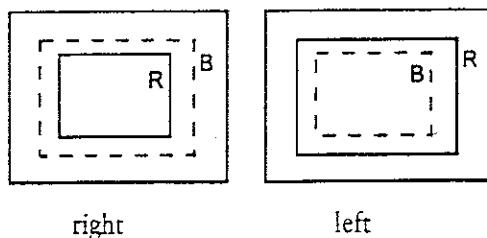

- (1) Receive the cross-hatch signal and adjust to get the best focus.
- (2) Receive the magenta cross-hatch signal and adjust the 4P magnet to align the Red/Blue cross hatch lines exactly one on top of another.
Rotation of the magnet (two magnets)—shifts the direction of two colors
Opening the magnet — shifts the distance between the two
- (3) Receive white cross-hatch signal. Rotate and adjust the 6P magnet to align the GREEN and MAGENDA cross-hatch lines exactly one on top of another.
Rotation of the magnet (two magnets)—shifts the direction of two colors
Opening the magnet — shifts the distance between the two
(The green pattern will remain stationary)
- (4) Repeat above step (2) and (3), if necessary.

V-5 Dynamic convergence

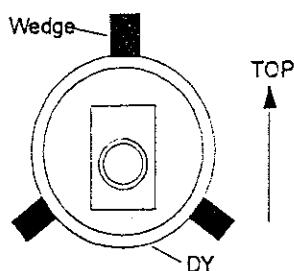

- (1) Receive the magenta cross-hatch signal and adjust the mis-convergece.
- (2) Move the DY top/downward and adjust the mis-convergence.

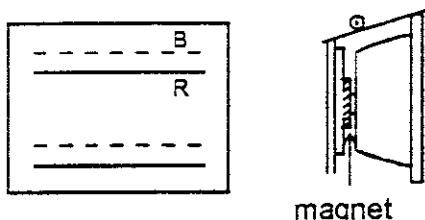

(3) Shift the DY right or left and adjust to minimize the mis-convergence of each corner.

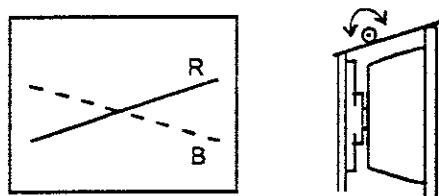

(4) Insert the wedge (08N46012A1) as follows and seal with silicon rubber (00F08221A1)

(5) Adjust the Yv by using magnet. (09F50363A1 or 09F50364A1) and seal with silicon rubber(08F08087A1)

(6) Adjust the Xv by the differential coil.

(7) If necessary, insert the ferrite sheet (08F50377A1) between the DY to CRT and adjust the mis-convergence of each corner area. After adjustment, seal with silicon rubber (08F08087A1)

V-6 Seal

- by YUKI Racker<yellow> (09F08139A1) at CP magnet, Screens on the DY, paint lock
- by silicone rubber (00F08221A1) <KE45RTV> at Wedge.

V troubleshooting

⚠ WARNING

When checking wave on the primary line, use the 2 pin power plug of oscilloscope.
Do not connect GND on the primary circuit and GND on the secondary circuit. (chassis)
If not, this may cause electric shock, damage to the circuit or breaker down.

⚠ WARNING

Do not check wave on the primary and secondary voltage line with same oscilloscope at same time. If necessary, connect the Isolation Trans for the power of monitor. This may cause an electric shock or damage to the circuit.

Please refer to the circuit Description section

1. No Display

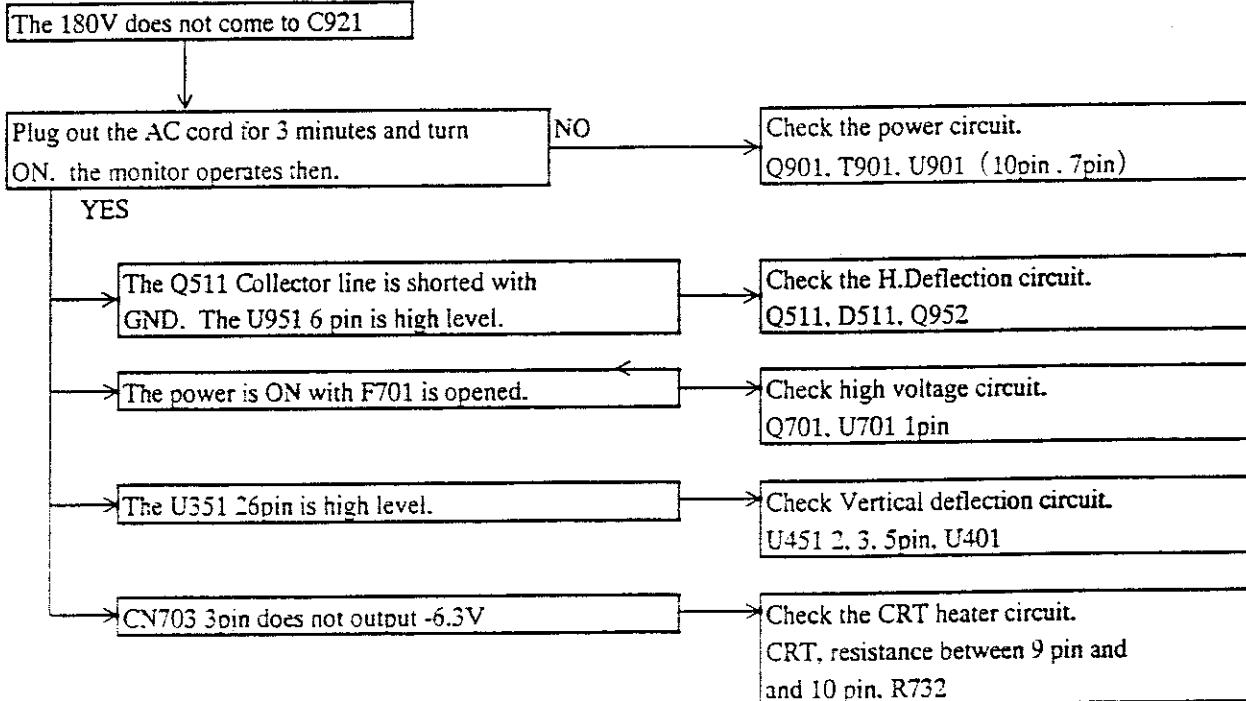

1-1. CRT heater does not light and the high voltage does not come

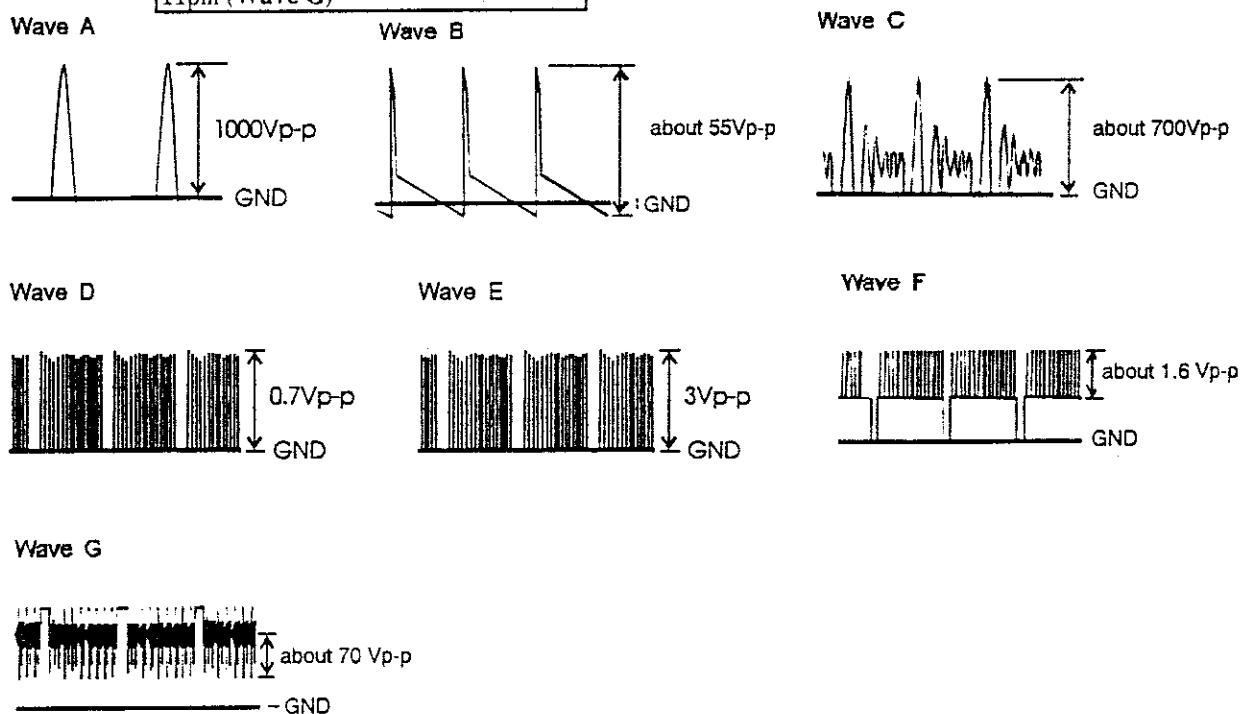

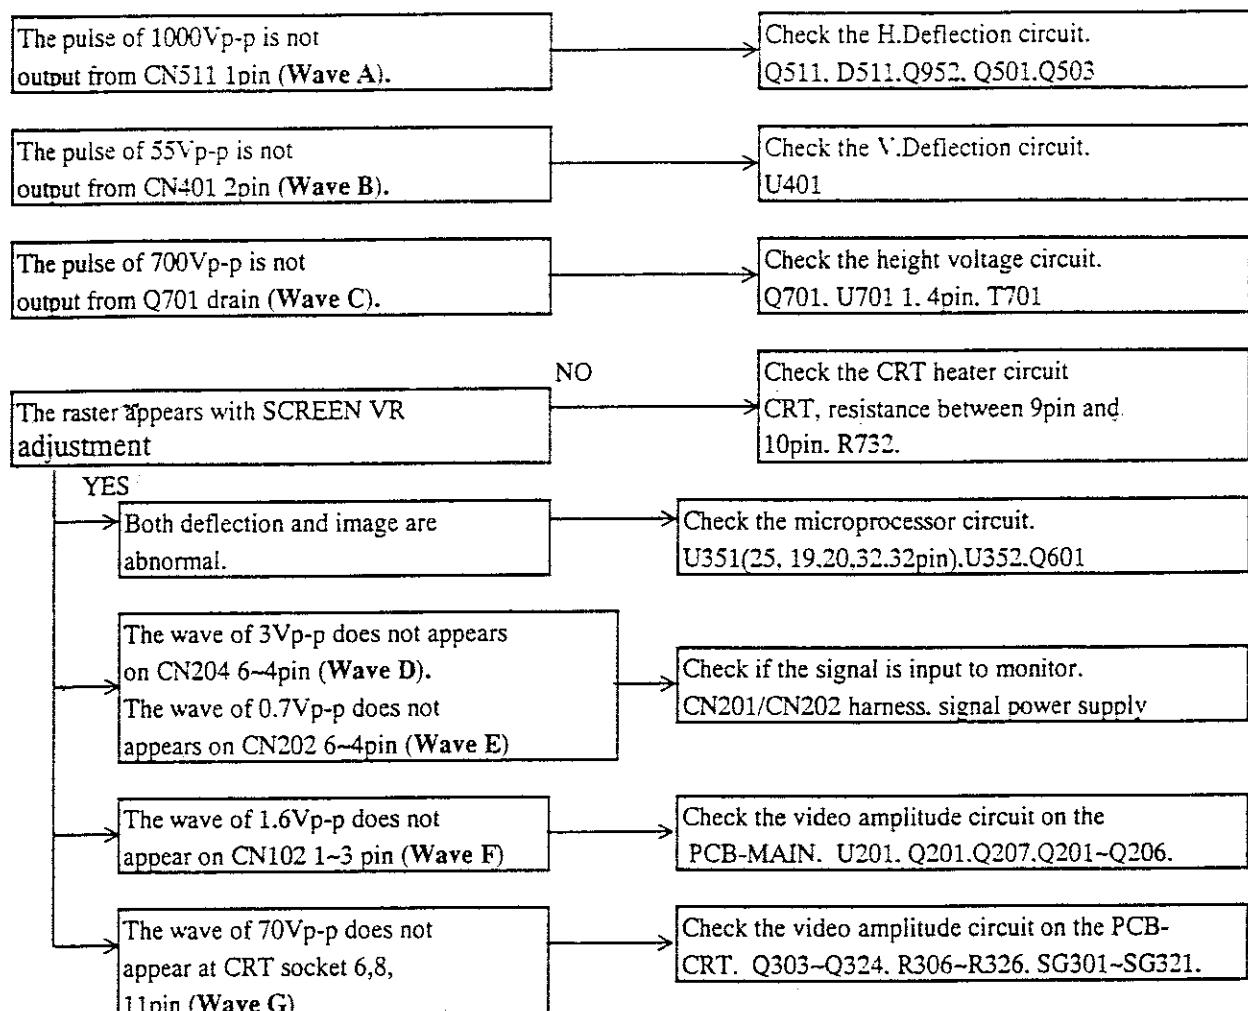

⚠ WARNING

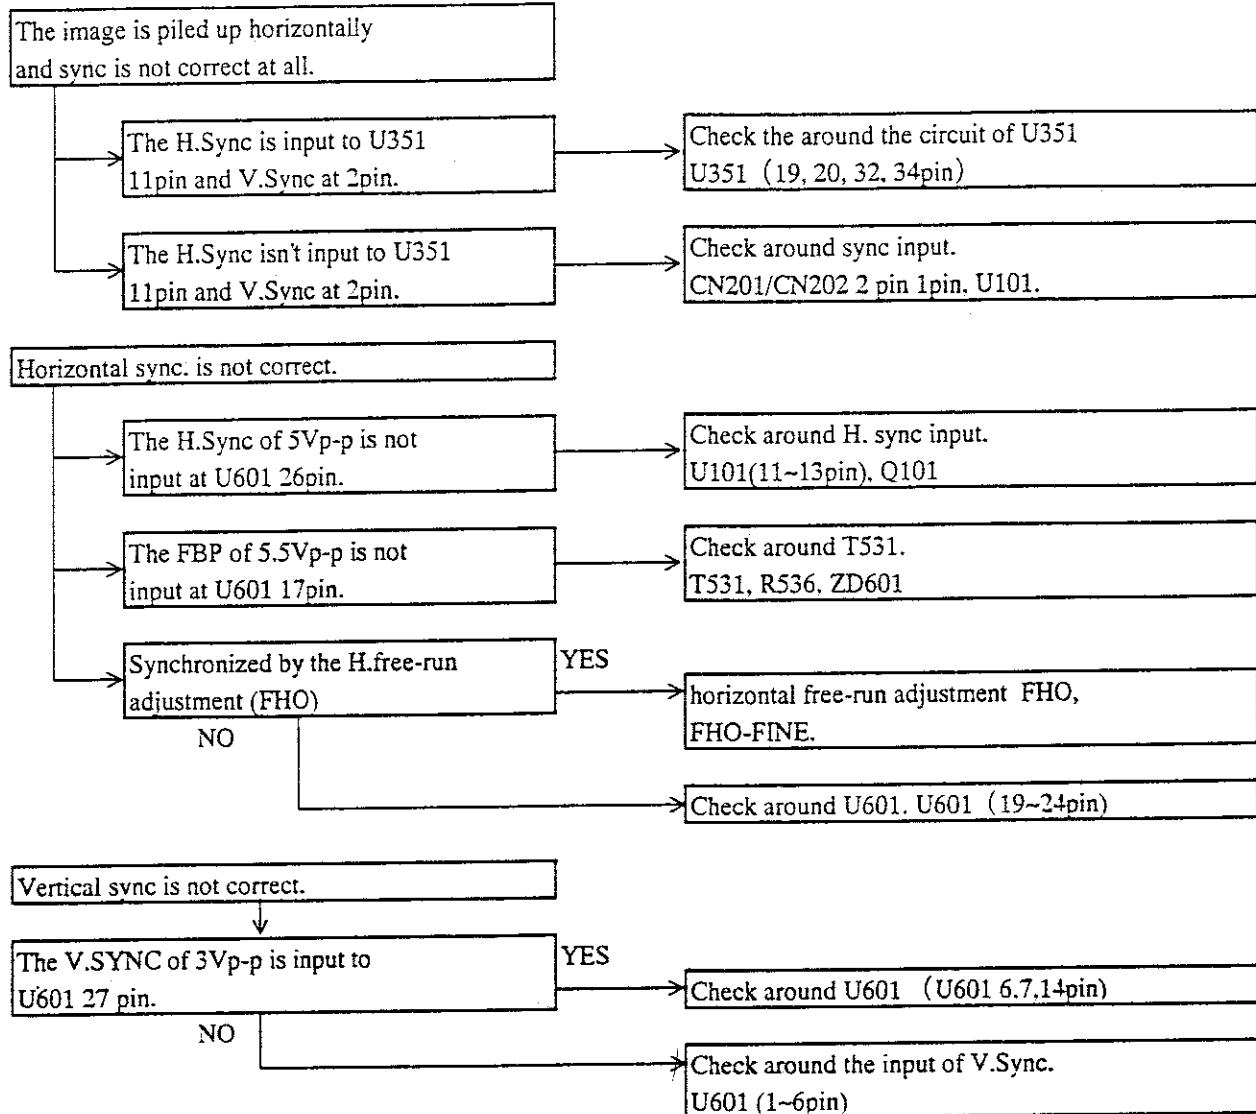

Handle the C905 with care to the electric shock or insulation because this is primary parts.

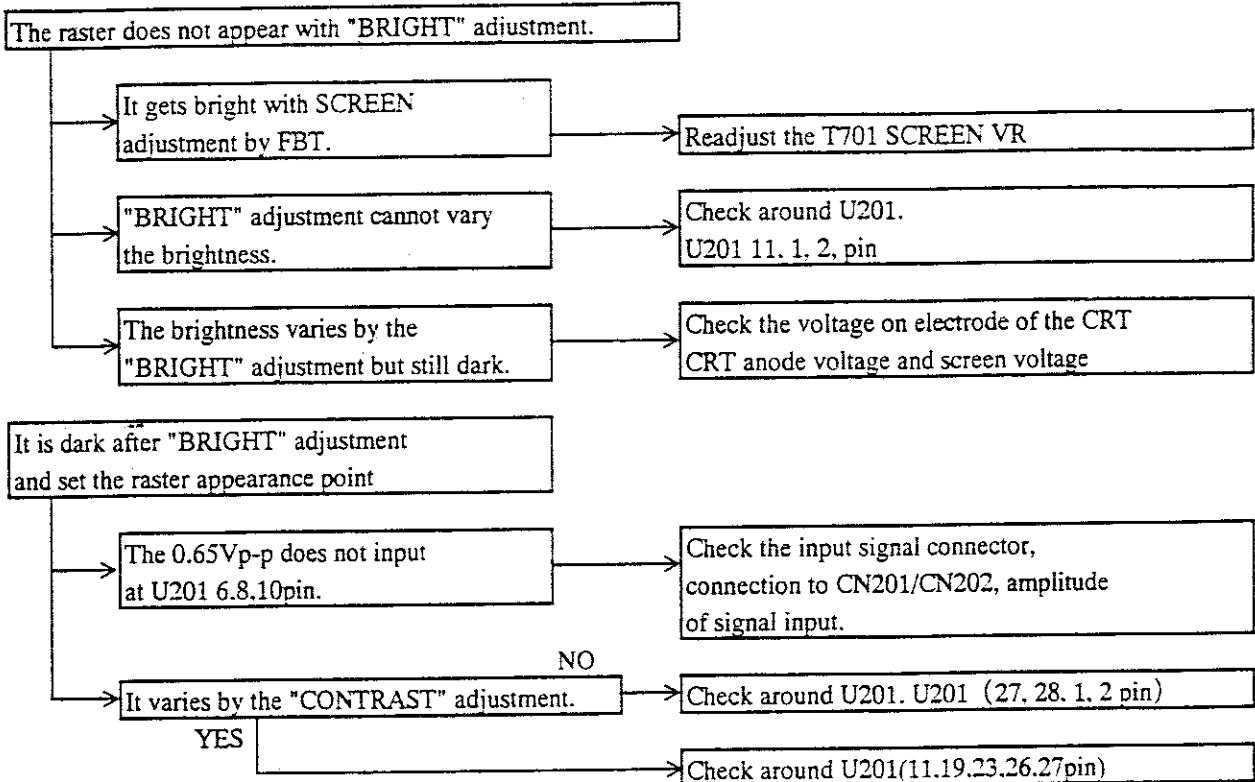

1-2. The CRT heater lights but no high voltage sound

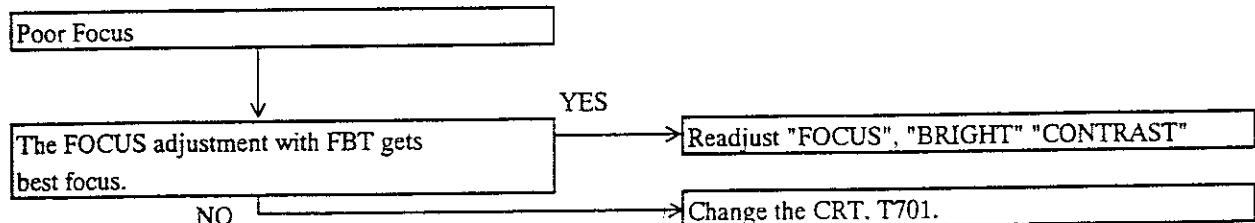

2. Sync is not correct

3. The image is too dark

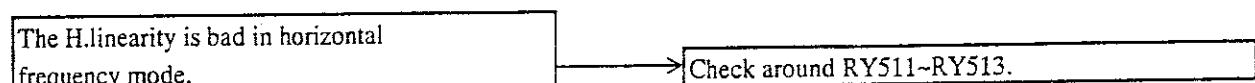

4. Poor Focus

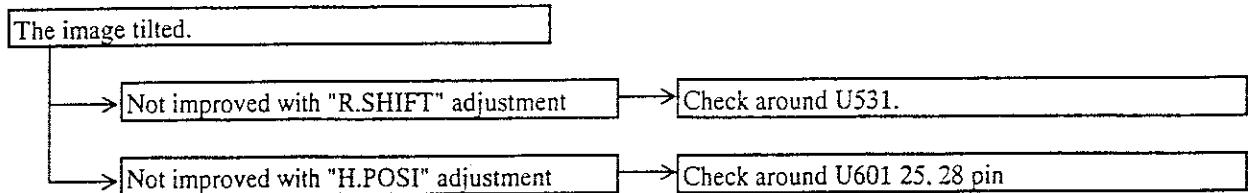

5. The adjustment data can not save

6. The H.linearity is bad in the H.frequency mode.

7. The image is tilted rightward/leftward

8. Degauss does not work.

9. Spot remains

SECTION VI : APPENDICES

1. Parts List for MS-2931

A Mark: Antistatic Parts
M Mark: Moisture Protection parts
S Mark: Safety related parts
X Mark: X-ray radiation related parts
OR: Substitute for the parts above

MS-2931-A/AW CONNECTION DIAGRAM

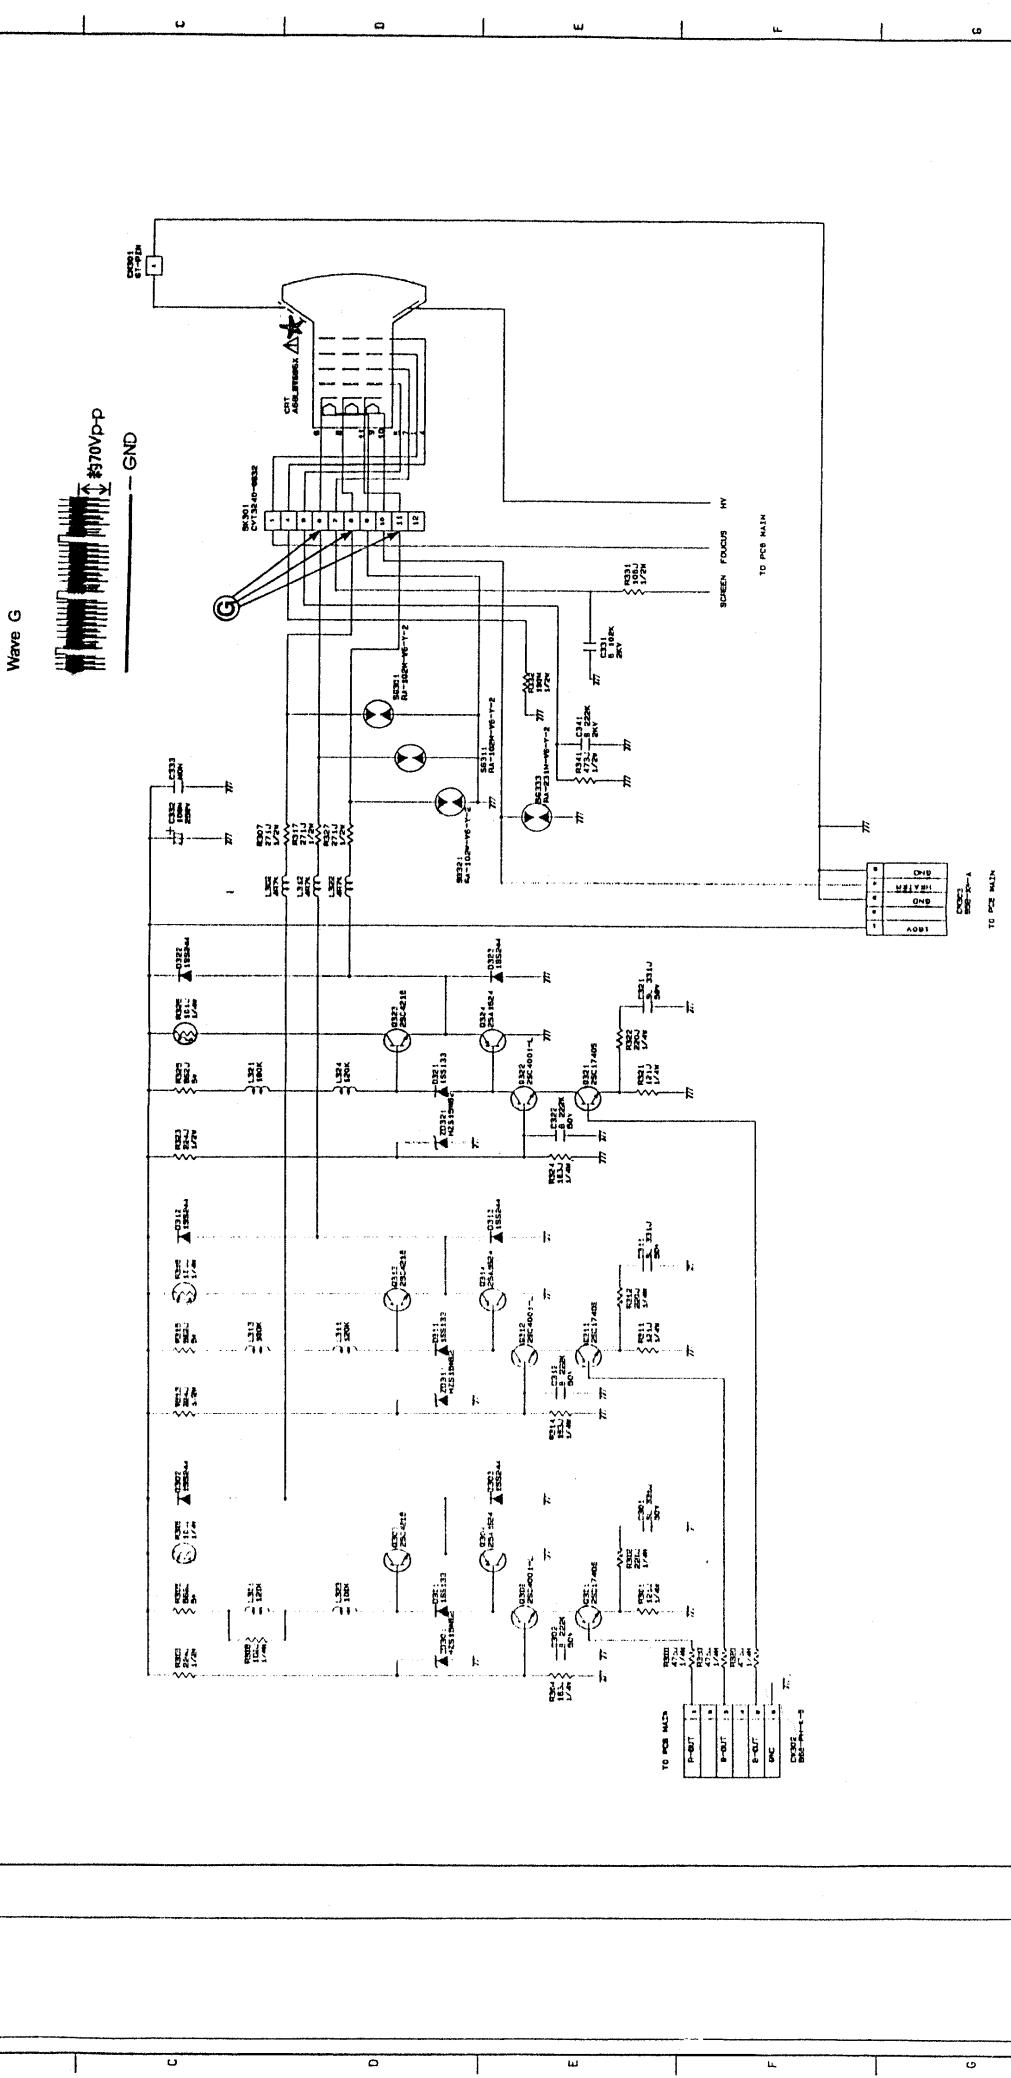

MS-2931-S/SW CONNECTION DIAGRAM

Missing area Very poorly scanned from start.
Tried to patch it, but 2 cm wide column still remains blank.

There once was a chap called Dangerous Peter, who's weenie got caught in his professional meter While measuring the voltage of 20k, his health came to be in serious decay Abnormal conditions his life to a nanc two-ka-
